# Technical Introduction and Features

# Overview

The *Quick-Start Tutorial for View in VMware Horizon 7* provides a technical overview of the View component of VMware Horizon® 7. The View component offers a virtual desktop infrastructure (VDI) and published applications through Remote Desktop Session Host (RDSH). This is done through a single platform, which simplifies desktop administration and operations, and enhances user experience. In comparison to physical desktops, delivering Horizon 7 virtual desktops from centralized [VMware vSphere](#)® servers enhances the security of applications and data and improves IT responsiveness, while at the same time reducing costs. The user enjoys a consistent and responsive experience across devices and locations, while maintaining IT-approved levels of customization.

## JMP - Next-Generation Desktop and Application Delivery Platform

JMP (pronounced *jump*), which stands for Just-in-Time Management Platform, represents capabilities in VMware Horizon 7 Enterprise Edition that deliver Just-in-Time Desktops and Apps in a flexible, fast, and personalized manner. JMP is composed of the following VMware technologies:

- [VMware Instant Clone Technology](#) for fast desktop and RDSH provisioning
- [VMware App Volumes™](#) for real-time application delivery
- [VMware User Environment Manager™](#) for contextual policy management

JMP allows components of a desktop or RDSH server to be decoupled and managed independently in a centralized manner, yet reconstituted on demand to deliver a personalized user workspace when needed. JMP is supported with both on-premises and cloud-based Horizon 7 deployments, providing a unified and consistent management platform regardless of your deployment topology. The JMP approach provides several key benefits, including simplified desktop and RDSH image management, faster delivery and maintenance of applications, and elimination of the need to manage “full persistent” desktops.

## Purpose

This tutorial is provided to help you evaluate Horizon 7. The first chapter provides an overview of View in Horizon 7 key features. Subsequent chapters contain exercises to guide you through the basic installation and initial configuration processes, and to explore key features and benefits.

**Note:** This tutorial is designed for evaluation purposes only. It uses the minimum required resources for a basic deployment and does not explore every feature. Do not use this evaluation environment as a template for a production environment. For information beyond the considerations of this tutorial, see [VMware Horizon 7 Documentation](#).

# Audience

This tutorial is intended for IT administrators, architects, engineers, and product evaluators who want to install Horizon 7 and deploy a VDI environment. Both current and new users can benefit from using this tutorial. You should be familiar with VMware vSphere and [VMware vCenter Server](#)<sup>®</sup>. Familiarity with other technologies is also helpful, including networking and storage in a virtual environment, Active Directory, identity management, directory services, and RSA SecurID.

# Advantages of Horizon 7

VMware Horizon 7 is a centralized desktop virtualization solution that enables organizations to deliver virtualized desktop services and applications to end users from centralized VMware vSphere servers. The VMware Horizon 7 solution includes a number of components, of which View is the main one.

Horizon 7 has advantages for both end users and IT administrators. End users are no longer restricted to one specific machine, and can access their system and files across supported devices and locations. As an IT administrator, you can use Horizon 7 to simplify and automate the management of desktops and applications, and you can securely deliver desktops as a service to users from a central location. You can quickly create virtual desktops on demand based on location and profile.

A single administration console provides detailed levels of control, allowing you to customize the end-user experience, access, and personalization to support corporate policy. End users get a familiar, personalized environment that they can access from any number of devices anywhere throughout the enterprise or from remote locations. And as an administrator, you have centralized control, efficiency, and security by storing desktop data in the data center.

# Packaging and Licensing

Horizon 7 is available in three editions—Standard, Advanced, and Enterprise—plus a Linux option. Each edition builds successively on the ones before, extending the capabilities with additional components and products. You can use the [VMware Horizon 7 Edition Selector](#) tool to help determine which edition is best for your enterprise.

VMware Horizon 7 Enterprise Edition is required for Just-in-Time Desktops and Apps. This edition includes User Environment Manager, for managing applications and Windows environment settings. User Environment Manager can manage applications installed in the base image of a virtual desktop machine or RDSH server, and it can manage applications provided by VMware App Volumes.

App Volumes delivers applications that are not in the master VM image. Application containers, called AppStacks, are assigned to a user, group, OU, or machine and mounted each time the user logs in to a desktop. With this strategy, user changes can persist between sessions.

App Volumes can also provide user-writable volumes, which allow users to install their own applications and have those applications follow the user as they connect to different virtual desktops.

For more information, see [VMware Workspace ONE and VMware Horizon Packaging and Licensing](#) and [Comparison Table for Horizon 7 Editions](#).

# Features

The features of Horizon 7 include:

- **Skype for Business solution:** Skype for Business is a unified communications platform that provides multiple forms of communication, such as instant messaging, VoIP (voice over IP), file transfer, web conferencing, voice mail, and email. You can provide an optimized Skype for Business solution to virtual desktops in your production environment to improve the user experience, secure collaboration, simplify management, and reduce costs. For more information, see [Horizon Virtualization Pack for Skype for Business](#).
- **Horizon Help Desk Tool:** The Horizon Help Desk Tool enables you to troubleshoot issues without specialists, including Linux desktop sessions. You can use this tool to search for users, find their sessions, initiate Microsoft Remote Assistance, and send user messages. If the issue requires it, you can use this tool to disconnect from a session, log out, and reset desktops to resolve the issue. The Horizon Help Desk Tool is available in the Horizon Console, and displays metrics for Skype for Business pairing status, application and desktop session states, and disk IOPS data. For more information, see [Using Horizon Help Desk Tool in Horizon Console](#).
- **Instant Clone Technology:** Instant Clone Technology, a key component of JMP ([Just-in-Time Management Platform](#)), provides the ability to rapidly create and provision virtual desktops based on a snapshot of a master image. You can create nonpersistent desktops that maintain user customization, user-installed applications, and more, from session to session. The desktop itself exists only until the user logs out, and then it is destroyed. New desktops are recreated from the latest master image. This eliminates many routine maintenance tasks, such as patching, and this in turn simplifies management. Instant clones are ideal for deploying pools of floating desktops. You can also use Instant Clone Technology in combination with [VMware User Environment Manager](#) and VMware App Volumes to rapidly create desktops that appear to be persistent. You can create pools where desktops are provisioned proactively, or create and provision desktops on demand for users to log in to. For more information, see [VMware Horizon 7 Instant-Clone Desktops](#).
- **Cloud Pod Architecture:** Cloud Pod Architecture (CPA) works with Horizon 7 to provide cross-data-center administration, flexible user-to-desktop mapping, high-availability desktops, and disaster recovery capabilities. For more information, see [Administering Cloud Pod Architecture in Horizon 7](#).
- **Blast Extreme:** Blast Extreme is a remote display protocol option, in addition to PCoIP and Microsoft RDP. Blast Extreme enables your users to connect to virtual desktops or RDSH applications through HTML Access or through VMware Horizon Client. Blast Extreme is based on the H.264 codec that supports the broadest range of client devices and can be set as the default for pools, farms, and entitlements. Blast Extreme automatically chooses UDP/TCP based on bandwidth, packet loss, delay, and jitter, which you can override with Blast GPO settings if need be. For more information, see [Blast Extreme Display Protocol in Horizon 7](#).
- **Linux virtual desktop capabilities:** [VMware Horizon 7 for Linux](#) includes key features such as USB redirection, Clipboard redirection, client-drive redirection (CDR), and HTML access with audio capabilities. Horizon 7 continues to support Linux-based virtual desktops, including Red Hat Enterprise Linux (RHEL), CentOS 64-bit operating systems, Ubuntu, SUSE, and

NeoKylin, as well as additional capabilities such as copying and pasting text between Linux virtual desktops and the client machine. You can access the Horizon Help Desk Tool to troubleshoot Linux desktop sessions, available from the Horizon Console. For more information, see [Setting Up VMware Horizon 7 for Linux Desktops](#).

- **Horizon 7 Published Applications:** Both Horizon 7 and [VMware Horizon Apps](#), can deliver virtualized Windows applications and shared desktop sessions from Windows Server instances using Microsoft Remote Desktop Services (RDS). You can publish business-critical Windows apps alongside SaaS and mobile apps in a single digital workspace, easily accessed with single sign-on from any authenticated device or OS.
- **Security capabilities:** Horizon 7 security features enable you to:
  - Use two-factor authentication, such as RSA SecurID, RADIUS, or smart cards to log in
  - Use Active Directory accounts when provisioning remote desktops and applications in environments that have read-only access policies for Active Directory
  - Use SSL tunneling to ensure that all connections are encrypted
  - Use VMware vSphere High Availability to ensure automatic failover in case of system failure
  - Prevent the server connection URL and Active Directory domains from being revealed in Horizon Client interfaces.
  - Use vSphere with Horizon 7 to encrypt full-clone virtual machines and manage the encryption using policies, independent of the guest OS of the virtual machines. For more information, see [VMware vSphere](#).
- **True single sign-on:** True SSO separates the process of authentication from that of access to desktops and applications. True SSO enables you to authenticate to [VMware Identity Manager™](#) or [VMware Workspace ONE®](#), and still access Horizon 7 desktops and applications without having to authenticate to Active Directory (AD). Users can also log in to VMware Identity Manager using non-AD methods, including biometrics, RSA SecurID, and RADIUS.
  - True SSO simplifies the login process to Windows desktops and published applications, especially when authenticating against third-party systems using non-AD methods. This results in a seamless process when accessing multiple desktops and published applications, which can make a significant difference to end users.
  - You can enable True SSO on a global level or on a pool level in Horizon 7.
- **Ease of management:** Horizon 7 provides centralized virtual desktop management, which enables you to:
  - Use Active Directory to manage policies and access to remote desktops and applications
  - Use the Horizon Administrator console to manage remote desktops and applications
  - Use master images to quickly create and provision pools of desktops
  - Send updates and patches to virtual desktops without affecting user settings, data, or preferences
  - Specify which types of USB devices end users can connect to
  - Split a composite device that provides multiple functions, such as both video input and storage, and allow one function but not the other (such as allowing video input, but not storage)
  - Integrate with VMware Identity Manager so that end users can access remote desktops through the VMware Identity Manager user portal on the Internet

- **Familiar desktop experience:** Horizon 7 continues to provide a familiar desktop experience for end users, including the ability to:
  - Print from a virtual desktop to any local or network printer that is defined on the client device, which solves compatibility issues without requiring additional print drivers on the virtual machine
  - Use location-based printing on most client devices to map to printers that are physically near the client system (which do require print drivers in the virtual machine)
  - Use multiple monitors, and adjust the display resolution and rotation separately for each monitor, with the PCoIP or Blast Extreme remoting protocols
  - Access USB devices and other peripherals connected to the local device that displays your virtual desktop
  - Work with rich 3D graphics

# Components and Architecture

# Introduction

Horizon 7 contains key components and integrated products that work together.

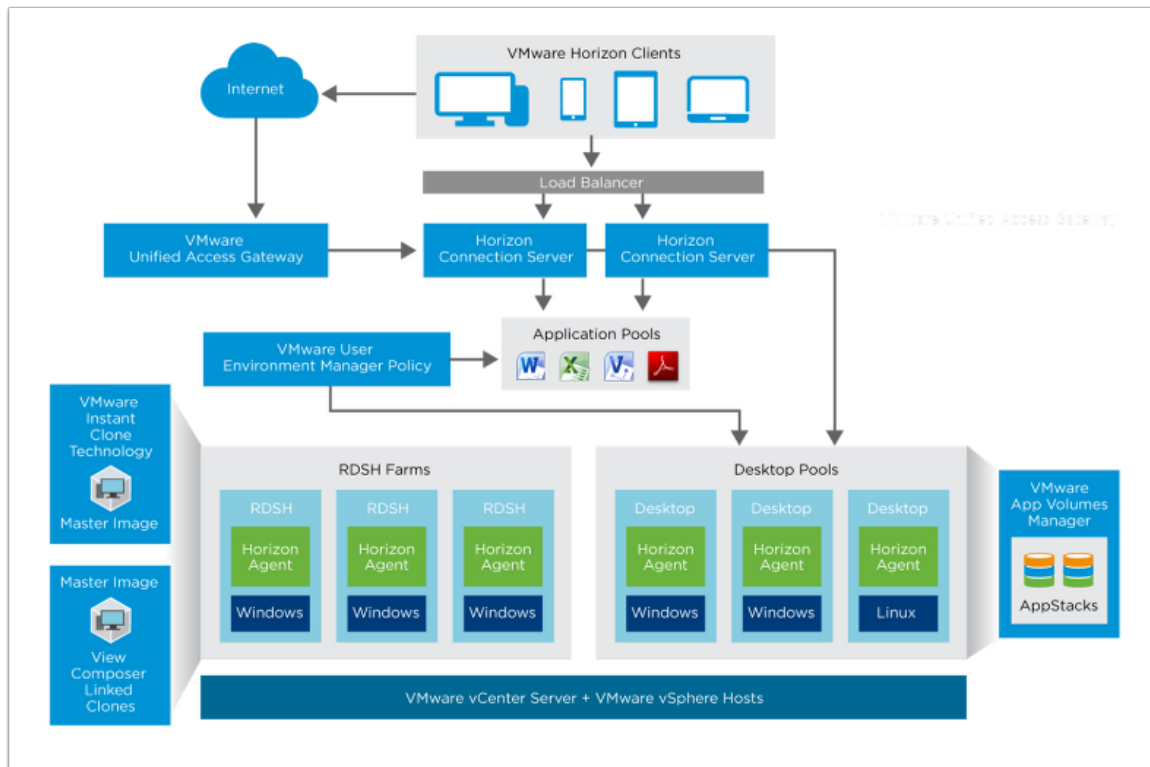

Figure: Horizon 7 Architecture Overview

This figure shows how Horizon components—such as Connection Server, User Environment Manager, App Volumes, vCenter Server, and vSphere—work together to provide access to virtual desktop pools, RDSH desktop and application pools, and more.

The core Horizon 7 components—including Connection Server, Horizon Client, and Horizon Agent—are described in [About Core Horizon 7 Components](#).

The underlying infrastructure components—including vCenter Server and vSphere—are described in [About Components Underlying Horizon 7](#).

User Environment Manager, App Volumes, and Unified Access Gateway are described in [About Components That Enhance Horizon 7](#).

# About Components Underlying Horizon 7

A number of key components provide the underlying foundation for Horizon 7.

## VMware vSphere Foundation for Horizon 7

VMware vSphere is a suite of virtualization products that provides a scalable platform for running virtual desktops and applications. The VMware vSphere Web Client is a browser-based application that you can use to configure the host and to operate its virtual machines.

For more information, see [VMware vSphere Documentation](#).

## VMware vCenter Server

[VMware vCenter Server](#), included in the vSphere suite, is the central management console for your vSphere infrastructure, virtual machines, and VMware ESXi™ servers. A vCenter Server can be quickly set up and deployed, using host profiles or Linux-based virtual appliances. The vCenter Server console provides centralized control and visibility into servers that host virtual desktops, ESXi servers, virtual machines, storage, networking, and other critical elements of your virtual infrastructure. You can use vCenter Server to allocate resources for improved performance.

For more information, see [VMware vSphere Documentation](#).

## VMware ESXi

[VMware ESXi](#) is a bare-metal hypervisor that can be installed directly onto your physical server, and partitioned into multiple virtual machines. Because ESXi runs on bare metal without an operating system, the footprint is reduced, giving a very small surface for possible malware and over-the-network attacks. This also simplifies deployment and configuration by reducing the number of configuration options.

For more information, see the [VMware ESXi Installation and Setup](#).

## About Core Horizon 7 Components

With Horizon 7, IT departments can run virtual machine (VM) desktops and applications in the data center and remotely deliver virtual desktops and applications to employees as a managed service. One advantage of Horizon 7 is that remote desktops and applications follow the end user regardless of device or location. Users can access their personalized virtual desktops or published applications from company laptops, their home PCs, thin client devices, Macs, tablets, or smartphones. The benefits to administrators include centralized control, efficiency, and security with desktop data stored in the data center.

Horizon 7 contains a number of core components.

# Horizon Administrator

Horizon Administrator is the classic web-based administrative console for managing users and Horizon 7 resources such as desktops and applications. Horizon Administrator is included when you install a Connection Server. With the use of Horizon Administrator, you can centrally manage thousands of virtual desktops from a single location.

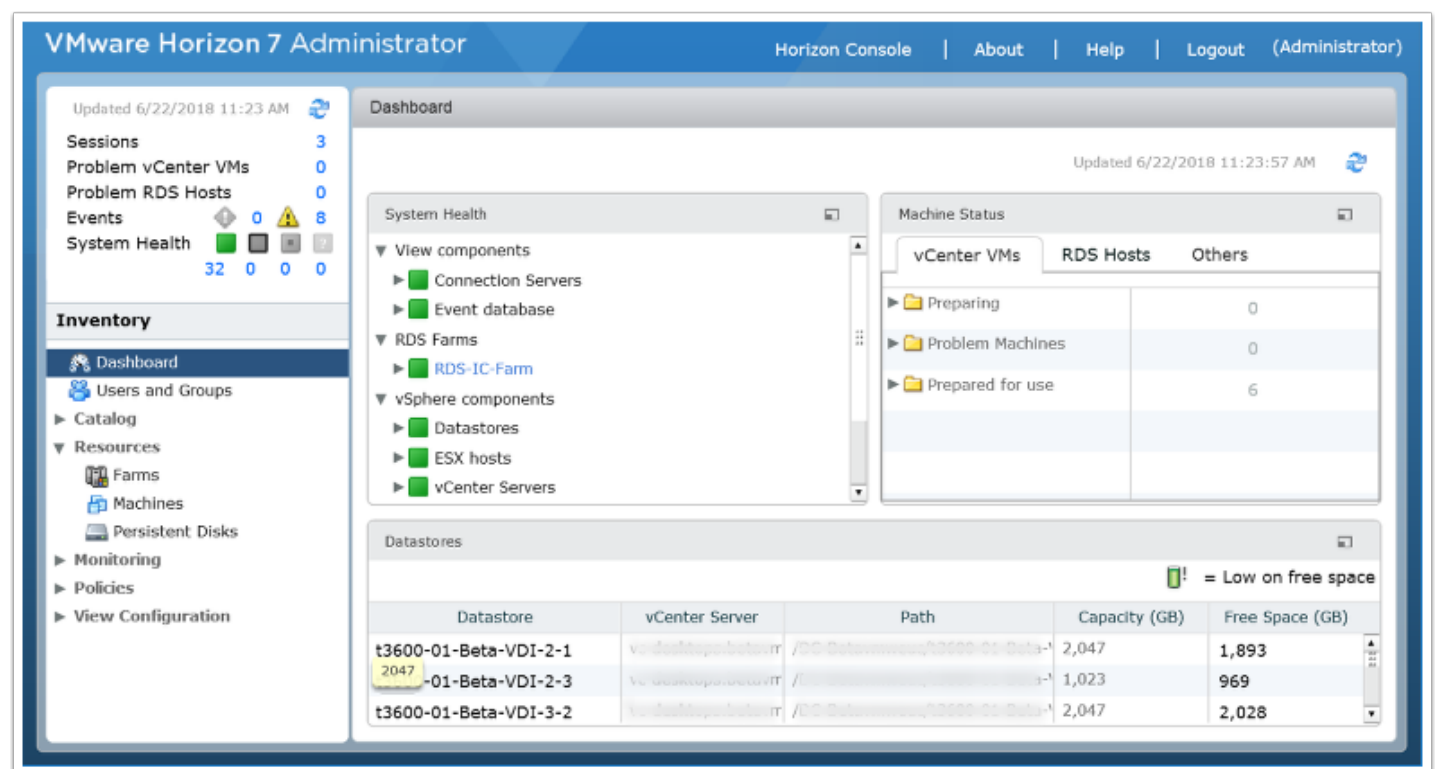

Figure: VMware Horizon Administrator

# Horizon Console

Horizon Console is the latest version of the Web interface through which you can create and manage virtual desktops and published desktops and applications. Horizon Console integrates VMware Horizon Just-in-Time Management Platform (JMP) Integrated Workflow features for managing workspaces.

Horizon Console includes a partial implementation of Horizon 7 features. You can use Horizon Administrator, the classic web interface, to access those features that are not yet available in Horizon Console.

To access Horizon Console, you log in to the Horizon Administrator, and click the Horizon Console button. You are authenticated through SSO. Horizon Console appears in a new tab, so both consoles are at your fingertips. You can also access Horizon Console from your browser:

<https://<connectionserver>/newadmin>.

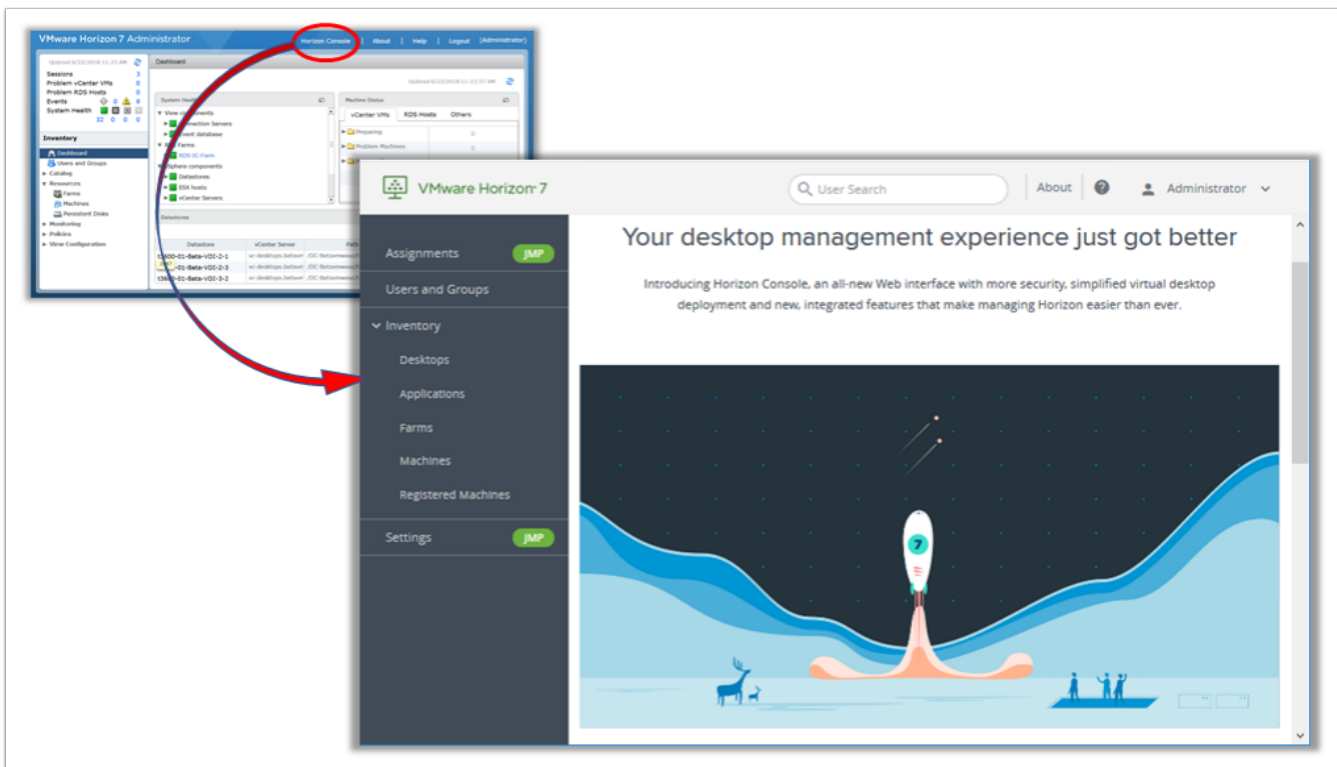

Figure: VMware Horizon Console

Horizon Console includes an easier desktop and application deployment process, just-in-time desktop delivery, and a more secure Web interface. Horizon Console also supports the following features:

- **Entitlements:** User, group, desktop, and application assignments
- **Authentication:** Remote access authentication and unauthenticated access for published apps

- **Virtual desktops:** Virtual desktop pool creation for automated, full clones, and instant clones, including dedicated assignments
- **Published desktops:** Published desktops with manual and instant-clone farms
- **Published applications:** Published applications with manual and existing application pools
- **Virtual machines:** VMs registered both with and without vCenter Server

For more information, see [VMware Horizon 7 documentation](#).

## Horizon Connection Server

The Horizon Connection Server brokers client connections by authenticating users and directing incoming user desktop and application requests. Users connect to a Connection Server to access their virtual desktops and native, virtual, or RDSH-based applications. The Connection Server provides the following management capabilities:

- Authenticating users
- Entitling users to specific desktops, applications, and pools
- Managing local and remote desktop and application sessions
- Establishing secure connections between users and desktops or applications
- Enabling single sign-on
- Setting and applying policies
- Managing an instant-clone engine

For more information, see [Horizon 7 Architecture Planning](#) and [Horizon 7 Installation](#).

## Composer (Optional)

The optional Horizon Composer is not required for instant clones. It enables you to create and manage pools of *linked-clone* desktops. The Composer server works with the Connection Servers and a vCenter Server. Composer is the legacy method that enables scalable management of virtual desktops by provisioning from a single master image using [linked-clone technology](#).

## Horizon Agent

Horizon Agent communicates between Horizon Client and virtual desktops or RDSH servers. You must install Horizon Agent on all virtual machines managed by vCenter Server so that Connection Server can communicate with the virtual machines. Horizon Agent also provides features such as connection monitoring, client drive redirection, virtual printing, and access to locally connected USB devices. This process can be simplified by installing Horizon Agent on the master image used to deploy virtual machines to a group of users.

# VMware Horizon Client

VMware Horizon<sup>®</sup> Client for Windows, Windows 10 UWP, macOS, iOS, Linux, or Android is installed on every endpoint. This enables your end users to access their virtual desktops and published applications from a variety of devices such as smartphones, zero clients, thin clients, PCs, laptops, and tablets.

Horizon Client enables users to do the following:

- Connect to a Connection Server, a VMware Unified Access Gateway<sup>™</sup> appliance, or a security server
- Log in to their remote desktops in the data center
- Edit the list of servers that they connect to

You can choose between multiple download processes. One option is to allow your end users to download Horizon Client directly from [Download VMware Horizon Clients](#). Another option is to determine which Horizon Client each end user can download, and store the Horizon Client installers on a local storage device using the View user portal (the default landing page for Connection Server).

For more information, see [Configure the VMware Horizon Web Portal Page for End Users](#).

# About Components That Enhance Horizon 7

Horizon 7 contains many products and components that can interoperate to extend and enhance your implementation. Access to and availability of these components varies, based on the edition of Horizon 7 installed. For more information about the different editions, see [VMware Workspace ONE and VMware Horizon Packaging and Licensing](#).

## VMware Unified Access Gateway

[VMware Unified Access Gateway](#) (formerly called [VMware Access Point](#)) provides a secure gateway that allows users to access their desktops and applications from outside a corporate firewall. You can design a Horizon 7 deployment that uses Unified Access Gateway for secure external access to internal Horizon 7 desktops and applications. Unified Access Gateway appliances typically reside in a demilitarized zone (DMZ) and act as a proxy host for connections inside your trusted corporate network. This structure shields Horizon 7 virtual desktops, servers, applications, and Connection Servers from the public Internet, adding an extra layer of security. In addition to security, Unified Access Gateway features include:

- Authentication in the DMZ
- Smart-card support
- Native RSA SecurID and RADIUS authentication
- Blast Extreme traffic directed to port 443 by default
- Security Assertion Markup Language (SAML) assertions

For more information, see the [Unified Access Gateway: Overview and Use Cases](#) video series.

## VMware App Volumes

[VMware App Volumes](#) is a real-time Windows application-delivery and application life-cycle-management solution. App Volumes uses application containers called *AppStacks*, which are virtual disks that contain all of the components that are required to run an application, such as executables and registry keys. When an AppStack is deployed, it is available for use within seconds without end-user installation. Applications can be deployed once to a single central file and accessed by thousands of desktops. This simplifies application maintenance, deployment, and upgrades.

App Volumes also provides user-writable volumes for a limited number of users. Writable volumes are a mechanism to capture user-installed applications that are not, or cannot be, delivered by AppStacks. This reduces the likelihood that persistent desktops would be required for a use case. The user-installed applications follow the user as they connect to different virtual desktops.

For more information, see [VMware App Volumes Documentation](#).

# VMware User Environment Manager

[VMware User Environment Manager](#) is a scalable solution for profile and policy management for virtual, physical, and cloud-based Windows desktop environments. You can use User Environment Manager to simplify your policy management by replacing and unifying problematic, unmaintainable, or complex login scripts and profile logic. You can map environmental settings, such as networks and printers, and dynamically apply end-user security policies and customizations. User Environment Manager ensures that each end user's settings and customizations follow them from one location to the next, regardless of the endpoint used to access their resources.

For more information, see [VMware User Environment Manager Technical Overview](#).

# VMware Identity Manager

[VMware Identity Manager](#) is a solution that provides application provisioning, a self-service catalog of applications and virtual desktops, conditional access controls, and single sign-on (SSO) for software as a service (SaaS), web, and cloud resources. VMware Identity Manager gives your IT team a central place to manage user provisioning and access policy with directory integration, identity federation, and user analytics.

For more information, see [VMware Identity Manager Documentation](#).

# Installation

# Introduction to Installation

The exercises in this Installation chapter are sequential and build upon one another, so make sure to complete each exercise before moving on to the next.

Most of the exercises explain, step by step with screenshots, exactly what to do. The one exception is the exercise [Create VMs for the Connection Server and Composer](#). The steps in that exercise point to another, companion document, which in turn includes detailed steps and screenshots. That exercise uses vSphere Web Client and involves vSphere tasks rather than showing you how to use Horizon 7. If you are already an intermediate or expert vSphere user, you can use the exercise just to note the specifications for OS and virtual hardware to be sure you have VMs you can use to host the Horizon servers.

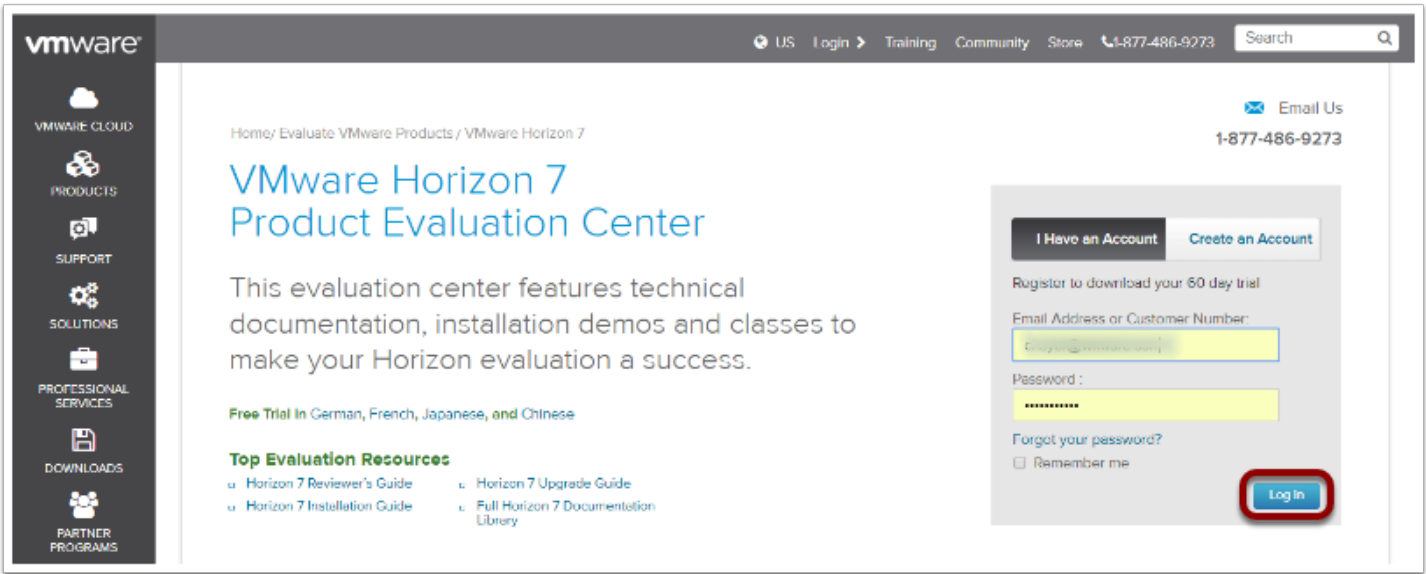

The exercises [Set Up the Composer Database](#) and [Install the Composer](#) are required only if you want to explore creating and using linked clones. Composer is the legacy method of optimizing your use of storage space and facilitating updates. For production environments, VMware recommends using instant clones rather than Composer linked clones.

This Installation chapter guides you through installing the necessary Horizon servers and databases. Installing and setting up Windows RDSH servers is not part of this initial installation and configuration. Setting up RDSH servers for use in linked-clone and instant-clone server farms that provide RDSH-published desktops and applications is discussed in the chapter [Creating RDSH-Published Desktops and Applications](#).

# Download Horizon 7 Installers

If you have purchased Horizon 7, you can download the installers (installation files) from the [Download VMware Horizon](#) page. This exercise shows you which installers to download and how to download the installers from the VMware Product Evaluation Center, which gives you a free 60-day trial.

## 1. Navigate to the Product Evaluation Center

On any web browser, navigate to the [VMware Horizon 7 Product Evaluation Center](#), and log in. If you do not already have an account, you can create one here.

## 2. Note the License

License Information		
COMPONENT	EXPIRATION DATE	LICENSE KEYS
Horizon 7 Enterprise	2015-08-12	D56
VMware Mirage	2015-08-12	
VMware Identity Manager	2015-08-12	
VMware ThinApp Client	2015-08-12	
VMware ThinApp Virtualization Packager	2015-08-12	
VMware vRealize Operations Manager	2015-08-12	

In the Product Evaluation Center, scroll down to the License Information, and make a note of the Horizon 7 Enterprise license.

### 3. Download the Horizon 7 Packages

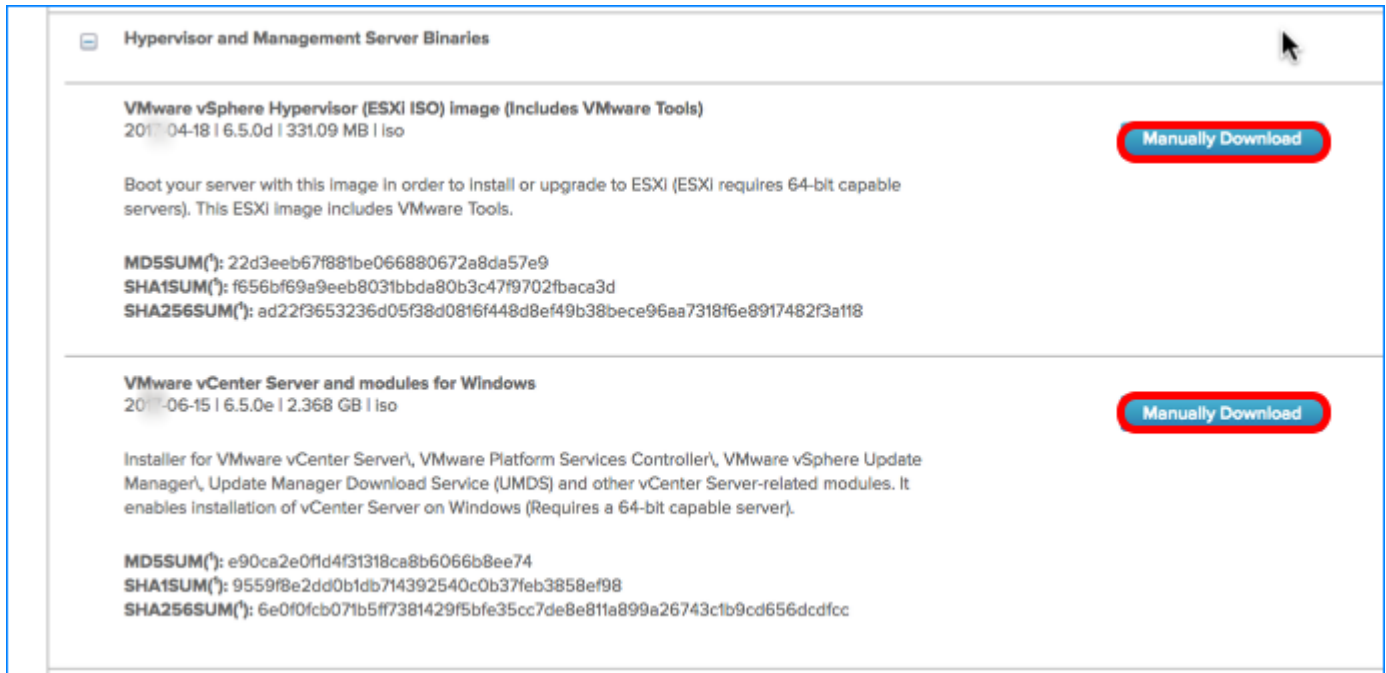

The screenshot shows the VMware Horizon Enterprise Edition Download Packages page. The left sidebar contains navigation links: VMware CLOUD, PRODUCTS, SUPPORT, SOLUTIONS, PROFESSIONAL SERVICES, DOWNLOADS, PARTNER PROGRAMS, and COMPANY. The main content area is titled 'Download Packages' and lists four packages under the 'VMware Horizon Enterprise Edition' section:

- Horizon 7.5.0 View Agent (64-bit)**  
2013-05-29 | 7.5.0 | 222.64 MB | exe  
Guest agent required for each remote desktop  
MD5SUM(\*): 03b58ea02d5a6da41e903b2ab369d87e  
SHA1SUM(\*): ca5efcb4a23808ac705708f69cf68d7660ec3e3  
SHA256SUM(\*): fbe6cea272299d78f887a58fbc3be1f3e3de78f1ef0fb85cbe9e5d10f2453f4  
[Manually Download](#)
- Horizon 7.5.0 View Connection Server (64-bit)**  
2013-05-29 | 7.5.0 | 233.05 MB | exe  
Connection Server to provision and manage desktops  
MD5SUM(\*): 9087060fe104da2b5c72c0b93c6e12f4  
SHA1SUM(\*): d724814e60637bfc0d4d1f8d0d29e8d7e40e5808  
SHA256SUM(\*): dd92d60f65b64fe624d9c86f99761f57ae876f8575a7aea7edc2946d215f5d54  
[Manually Download](#)
- Horizon 7.5.0 View Composer**  
2013-05-29 | 7.5.0 | 31.81 MB | exe  
Separate installable component to provision linked clone desktops in View Manager from a central master image  
MD5SUM(\*): 0103fa8e068b5d1297342a56ac8a10e8  
SHA1SUM(\*): 399a3e5eb069e88c9337048a05dfe020593c0e2  
SHA256SUM(\*): 5a3700ac6ce376738cec68cf5a76a096358fd3efdccc362aeeb56d552bdc1f22  
[Manually Download](#)
- Horizon 7.5.0 JMP Server**  
2013-05-29 | 7.5.0 | 102.07 MB | exe  
MD5SUM(\*): ddec9f8eaa4ef0ab59fb7ba694b12234  
SHA1SUM(\*): 06a772fe668fd5769eb09bc836d7c1029fb00ec5  
[Manually Download](#)

Scroll down to Download Packages, expand the VMware Horizon Enterprise Binaries section, and download the following packages, and note where you store them for reference during the installation process:

- Horizon Connection Server (64-bit)
- Horizon Agent (64-bit)
- Horizon Composer

## 4. Download vSphere Packages

If you do not already have a vSphere environment set up, scroll down and expand the **Hypervisor and Management Server Binaries** section, and download the following packages:

- VMware vSphere Hypervisor (ESXi ISO) image (Includes VMware Tools)
- VMware vCenter Server and modules for Windows

Before you can perform the exercises in this guide, you must have a VMware vSphere 6 infrastructure that contains at least one VMware ESXi host and one vCenter Server instance. This guide does not provide instructions for installing these vSphere components. For instructions see the [vSphere Product Documentation](#).

# 5. Download Horizon Client

Download VMware Horizon Clients

Select Version:

4.0

VMware Horizon Clients for Windows, Mac, iOS, Linux, and Android allow you to connect to your VMware Horizon virtual desktop from your device of choice giving you on-the-go access from any location.

Navigate to [Download VMware Horizon Clients](#) and download VMware Horizon Client (64-bit). Horizon Client is required for exercises in other chapters.

# Infrastructure Requirements

Before you begin the installation exercises in this guide, make sure that your environment meets the following infrastructure requirements:

- **VMware vSphere and vCenter Server** – Before you can perform the exercises in this guide, you must have a [VMware vSphere](#) 6 infrastructure that contains at least one VMware [ESXi host](#) and one [VMware vCenter Server](#) instance. This guide does not provide instructions for installing these vSphere components. For instructions see the [vSphere Product Documentation](#).
- **Active Directory domain controller** – The authentication infrastructure for your setup must include Active Directory, DNS, and DHCP is required. Horizon 7 integrates with your Microsoft Active Directory, a Windows service for authenticating and authorizing users and computers, applying and enforcing security policies, and installing and updating software. The Connection Server joins to Active Directory and sets up a lightweight directory service instance for the storage of View configuration information.
- **SSL certificate** – (Optional) By default, Horizon 7 includes a self-signed certificate that can be used for testing purposes. For a production environment, we recommend that you replace the self-signed certificate with an approved certificate signed by a certificate authority, a trusted entity that issues digital certificates verifying another digital entity's identity on the Internet.
- **SQL database server** – This is the database server on which you will create the event database. For the example in this exercise, we used Microsoft SQL Server 2016. To simplify the setup for completing this tutorial in a lab setup, we recommend that you use the same SQL Server instance for the event database, the Composer database, and the JMP server database. For a list of databases that support all three of these components, see [Database Requirements for JMP Server](#).  
**Note:** You can download and install [Microsoft SQL Server Management Studio Express](#) with Advanced Services to get both database and management tools, or use an existing SQL server in your environment.
- **Network** – VMware recommends a network connection speed of at least 1 Gbps between all the required Horizon 7 components and desktops.

# Create VMs for the Connection Server and Composer

For the exercises in this guide, you must have VMs on which to install the Connection Server, the Microsoft SQL Server database server, and, optionally, the Composer server. For this purpose, you create a VM template and clone it to create the required VMs for the server components.

**Note:** If you already have a vSphere environment set up and VMs with Windows Server installed, you can probably use those or clone them. If not, you can use the procedure in this exercise.

## Prerequisites for Creating the Connection Server and Composer Server

To perform this exercise, you need a [VMware vSphere](#) 6 infrastructure that contains at least one VMware [ESXi host](#) and one [VMware vCenter Server](#) instance. This guide does not provide instructions for installing these vSphere components. For instructions see the [vSphere Product Documentation](#).

### 1. Create a VM

Step-by-step instructions for using vSphere Web Client to create a VM are beyond the scope of this tutorial, and are already provided in a companion guide. See the section [Create a Virtual Machine](#), in the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#).

Use the following specifications.

Attribute	Specification
OS	Windows Server 2016
vCPU	4
Memory	4 GB
Hard Disk	40 GB
SCSI Controller	LSI Logic SAS
Compatibility level	ESXi 6.7 and later

Attribute	Specification
Windows version	Windows Server 2016 Standard (Desktop Experience) or Windows Server 2016 Datacenter (Desktop Experience)

## 2. Install the Windows Server Operating System

Step-by-step instructions for installing the OS in a VM are beyond the scope of this tutorial, and are already provided in a companion guide. See the section [Install Windows](#), in the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#). For the Windows Operating system, we recommend using one of the following:

- Windows Server 2016 Standard (Desktop Experience)
- Windows Server 2016 Datacenter (Desktop Experience)

For a list of all possible supported operating systems, see [Supported Operating Systems for Horizon Connection Server](#).

## 3. Update Windows

Step-by-step instructions for updating Windows are beyond the scope of this tutorial, and are already provided in a companion guide. See the section [Update Windows and Run Ngen and DISM](#), in the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#).

## 4. Install VMware Tools

Step-by-step instructions for installing VMware Tools are beyond the scope of this tutorial, and are already provided in a companion guide. See the section [Install VMware Tools](#), in the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#).

## 5. Change the Network Adapter to VMXNET 3

Step-by-step instructions for changing the network adapter type from E1000 to VMXNET 3 are included in the procedure [Optimize the Hardware](#), in the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#).

**Important:** Do not perform the exercises in [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#) for installing the RDSH role. For the purposes of creating Horizon Connection Server, the database server, and the Composer server, the servers should

not have the RDSH role installed. That role is for servers that will be used to create RDSH server farms.

## 6. Clone the VM to a Template

For instructions cloning a VM to a VM template, see the vSphere product documentation topic [Clone a Virtual Machine to a Template](#).

## 7. Deploy VMs from the Template

Deploy VMs as needed for the following Horizon servers:

- Connection Server
- Microsoft SQL Server, if you do not already have a server to use
- Composer, if you plan to perform the exercises for creating linked clones

For instructions on deploying VMs from a VM template, see the vSphere product documentation topic [Deploy a Virtual Machine from a Template](#).

You can edit the virtual hardware settings for the number of vCPUs and the amount of memory as you complete the Deploy Template wizard. You do not need to edit these settings, but you can if you wish. For information about minimum requirements, see the following product documentation topics:

- [Hardware Requirements for Horizon Connection Server](#)
- [Hardware Requirements for Standalone View Composer](#)

# Install Horizon Connection Server

After downloading the installation files, start the installation process by installing the Connection Server on a virtual machine.

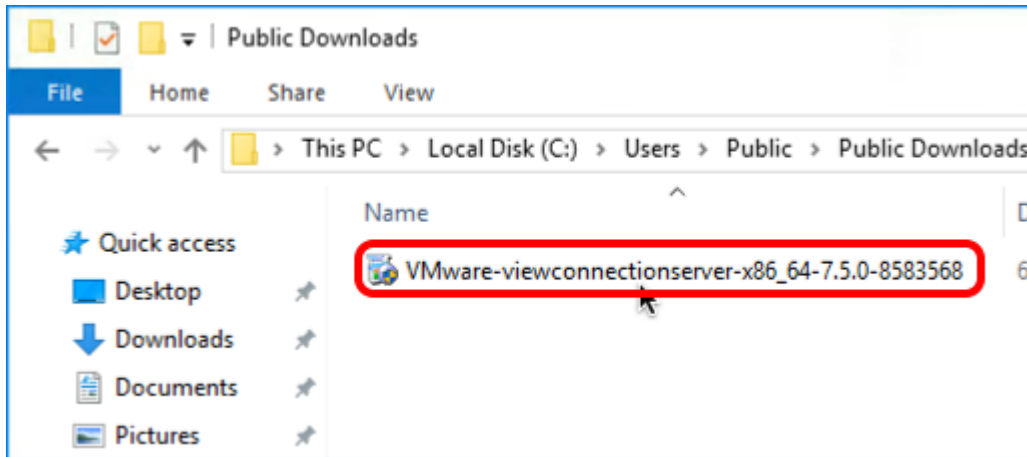

The Connection Server acts as a broker for client connections by authenticating and directing incoming user desktop requests. When you install the Connection Server, the Horizon Administrator is installed as well. The Horizon Administrator is the web-based interface for the management, provisioning, and deployment of virtual desktops. As an administrator, you can centrally manage thousands of virtual desktops from a single Horizon Administrator.

## Prerequisites for Connection Server Installation

To perform this exercise, you will need the following:

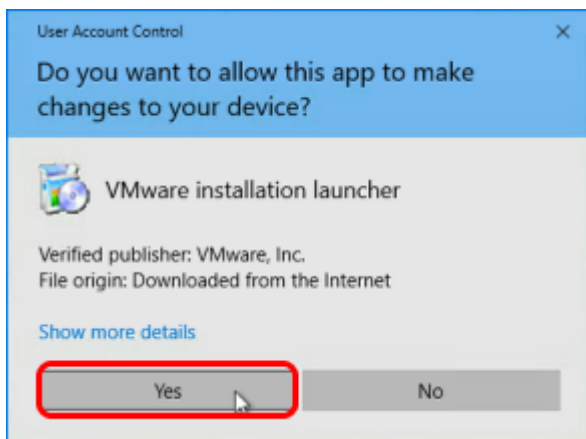

- **User account** – When you log in to the OS to run the installer, the account you use must have administrative privileges.
- **Installer** – If necessary, you can download the installer from the [Download VMware Horizon](#) page or the [VMware Horizon 7 Product Evaluation Center](#). You must download and copy the installer file to the Connection Server VM, or, alternatively, you can copy it to a location accessible to the system.
- **VM that satisfies virtual hardware requirements** – If you performed the exercise [Create VMs for the Connection Server and Composer](#), you have an appropriate VM. If you did not perform that exercise, make sure that the VM you have adheres to the specifications listed in the product documentation topic [Hardware Requirements for Horizon Connection Server](#).
- **Windows OS** – The system must be running a supported Windows version. We recommend Windows Server 2016. for a complete list of supported operating systems, see [Supported Operating Systems for Horizon Connection Server](#).
- **Static IP address** – The system must have an IP address that does not change. In an IPv4 environment, configure a static IP address. In an IPv6 environment, machines automatically get IP addresses that do not change.
- **Supported browser with Adobe Flash installed** – The last step of this procedure has you log in to Horizon Administrator, which requires a web browser with Adobe Flash 10.1 or later installed. The latest versions of most browsers are supported. For a complete list, see [Horizon Administrator Requirements](#).
-

## 1. Run the Connection Server Installer

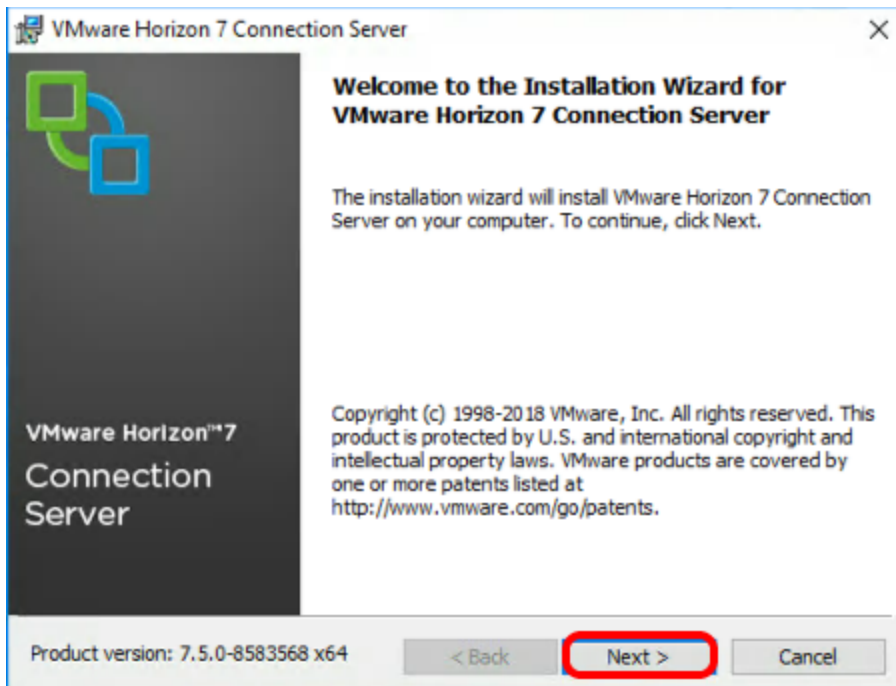

Navigate to the Connection Server installation file that you downloaded earlier, and double-click the file to start the installation wizard.

## 2. Permit Changes to Device

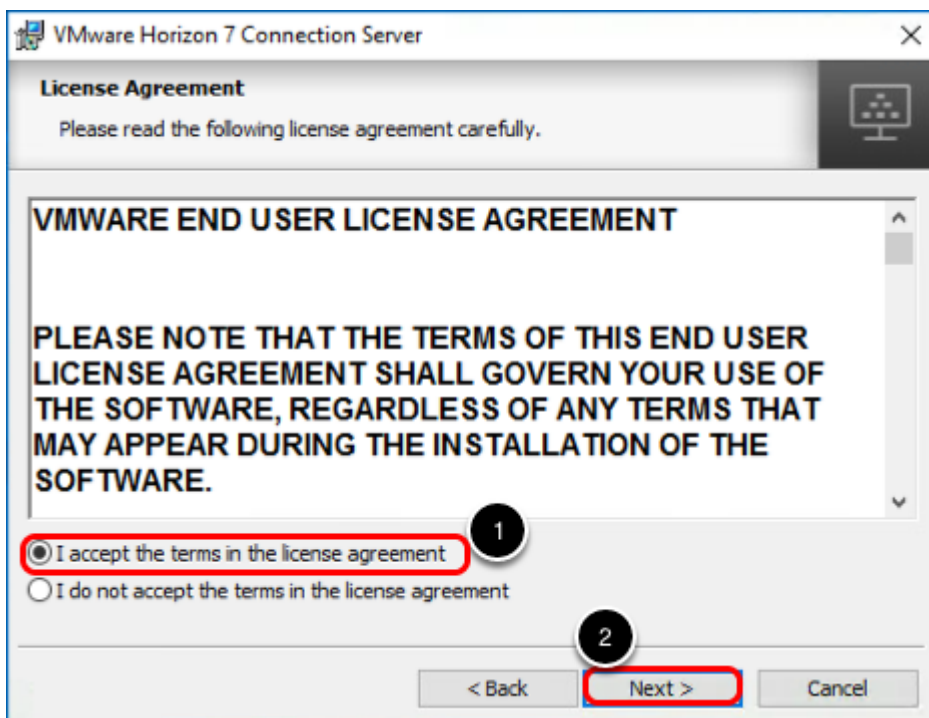

If asked whether to allow changes to your device, click Yes.

### 3. Click Next on the Welcome Page

On the installation wizard Welcome page, click Next.

### 4. Accept the License Agreement

1. Select I accept the terms in the license agreement.

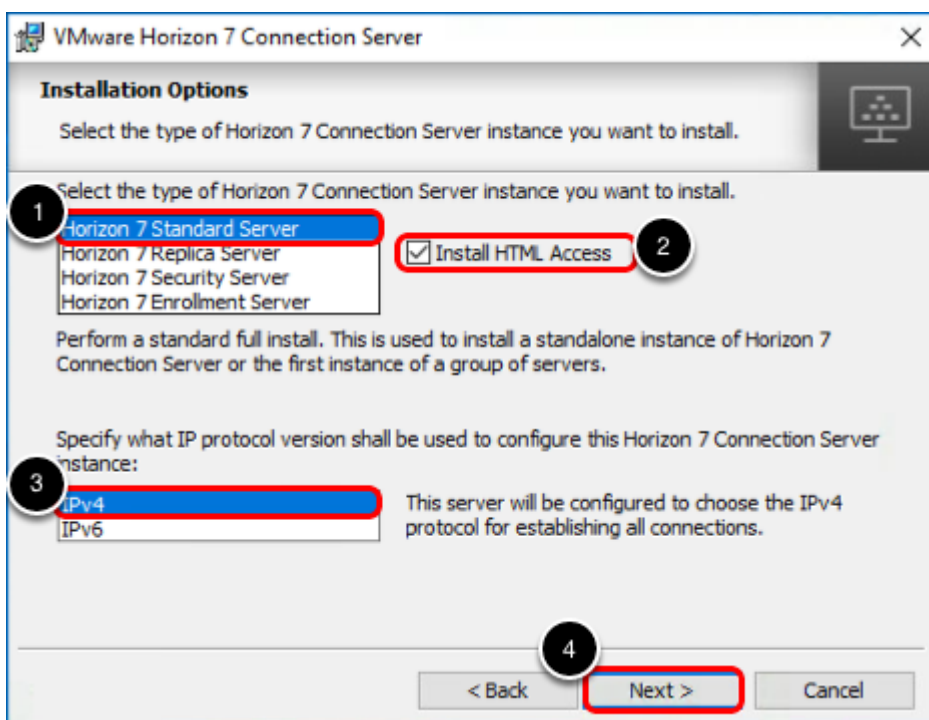

2. Click Next.

## 5. Accept the Default Installation Directory

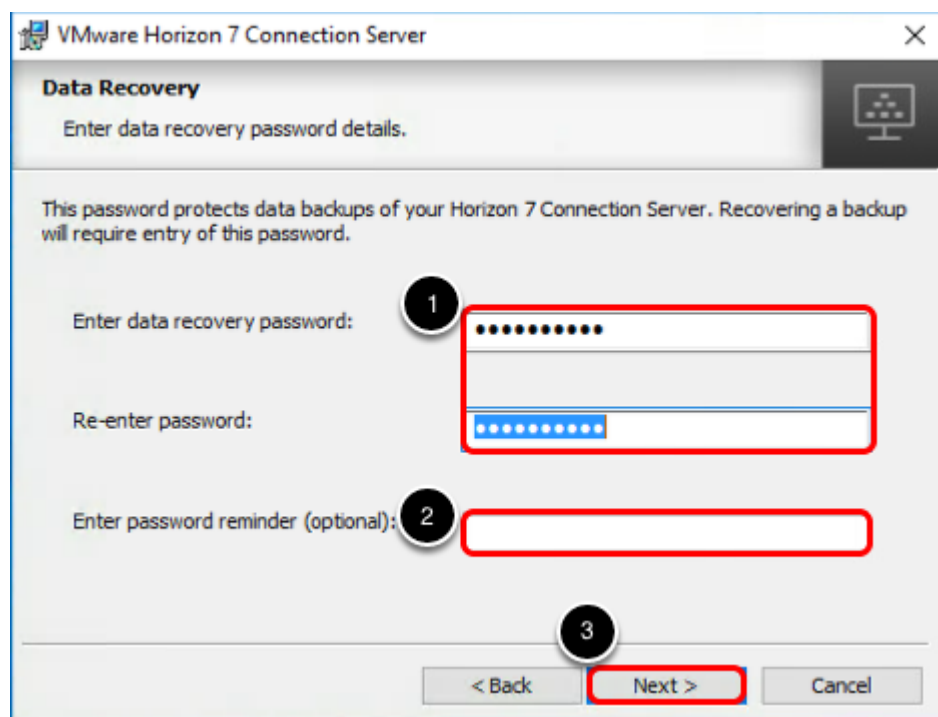

Click Next.

## 6. Select Installation Options

1. Select the Horizon 7 Standard Server installation option.
2. Select the Install HTML Access option to allow users to connect through web browsers.
3. Accept the default IPv4 protocol option.
4. Click **Next**.

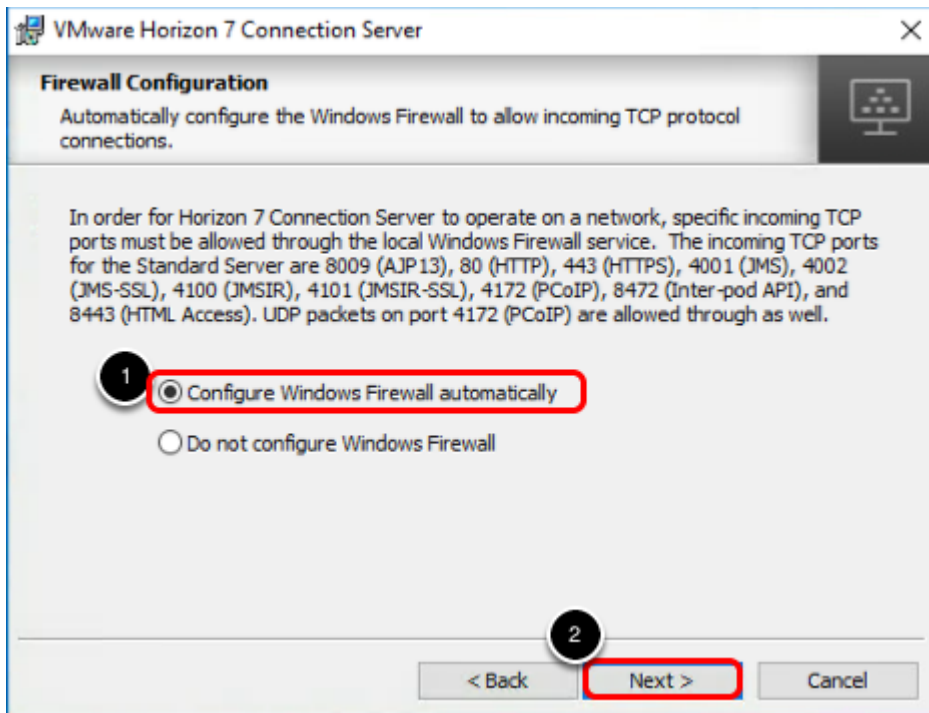

## 7. Establish a Data Recovery Password

The screenshot shows the 'Data Recovery' window of the VMware Horizon 7 Connection Server. The window title is 'VMware Horizon 7 Connection Server'. The main heading is 'Data Recovery' with a subtext 'Enter data recovery password details.' Below this, a message states: 'This password protects data backups of your Horizon 7 Connection Server. Recovering a backup will require entry of this password.' There are three input fields: 'Enter data recovery password:' (with a red box and a circled '1'), 'Re-enter password:' (with a red box), and 'Enter password reminder (optional):' (with a red box and a circled '2'). At the bottom, there are three buttons: '< Back', 'Next >' (with a red box and a circled '3'), and 'Cancel'.

1. In the Data Recovery window, enter the password.
2. You can enter an optional reminder for future reference.
3. Click **Next**.

## 8. Configure the Firewall Automatically

1. Accept the default to configure the firewall automatically.
2. Click Next.

## 9. Specify the User or Group Who Will Have Full Administrative Privileges

VMware Horizon 7 Connection Server

**Initial Horizon 7 Administrators**

Specify the domain user or group for initial Horizon 7 administration.

To login to Horizon 7 Administrator, you will need to be authorized. Select the local Administrators group option or enter the name of a domain user or group that will be initially allowed to login and will be granted full administrative rights.

The list of authorized administrator users and groups can be changed later in Horizon 7 Administrator.

1 ☐ Authorize the local Administrators group

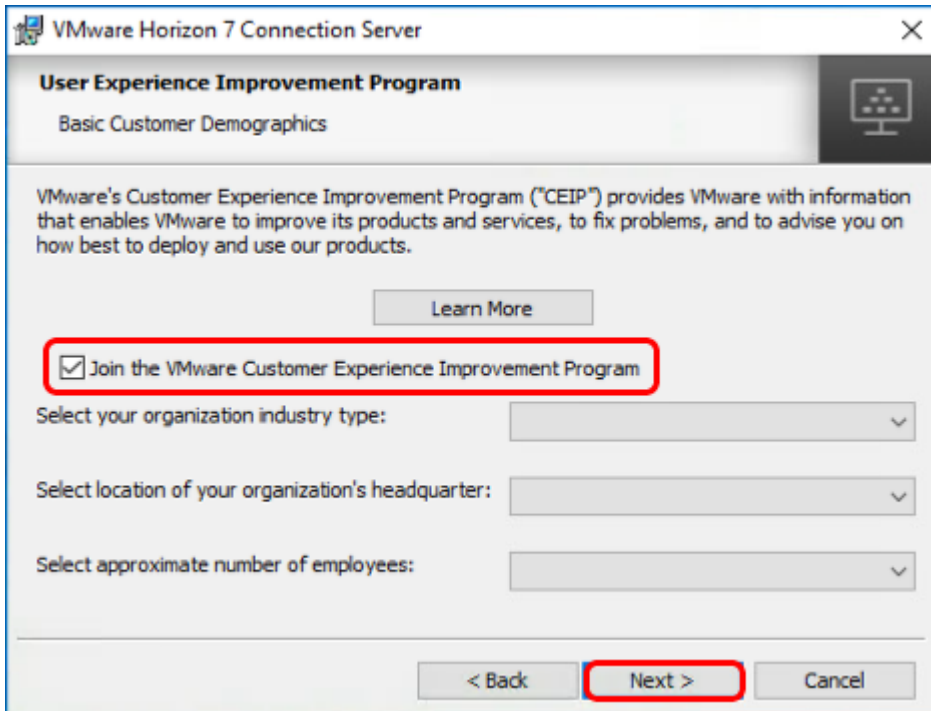

☒ Authorize a specific domain user or domain group

(domainname\username, domainname\groupname or UPN format)

2

1. Enter the domain user or domain group to authorize access to the Horizon Administrator.
2. Click **Next**.

## 10. Choose the User Experience Option

The screenshot shows the 'User Experience Improvement Program' window in VMware Horizon 7 Connection Server. The window title is 'VMware Horizon 7 Connection Server'. The main heading is 'User Experience Improvement Program' with a sub-heading 'Basic Customer Demographics'. A paragraph explains that VMware's Customer Experience Improvement Program (CEIP) provides information to improve products and services. Below this is a 'Learn More' button. A checkbox labeled 'Join the VMware Customer Experience Improvement Program' is checked and highlighted with a red rectangle. Below the checkbox are three dropdown menus: 'Select your organization industry type:', 'Select location of your organization's headquarter:', and 'Select approximate number of employees:'. At the bottom, there are three buttons: '< Back', 'Next >' (highlighted with a red rectangle), and 'Cancel'.

1. In the User Experience Improvement Program window, you can deselect the Join the VMware Customer Experience Improvement Program option to opt out of the program.
2. Click Next.

## 11. Install the Components You Selected

In the Ready to Install the Program window, click Install.

## 12. Click Finish

Click **Finish** to close the wizard.

## 13. Navigate to Horizon Administrator

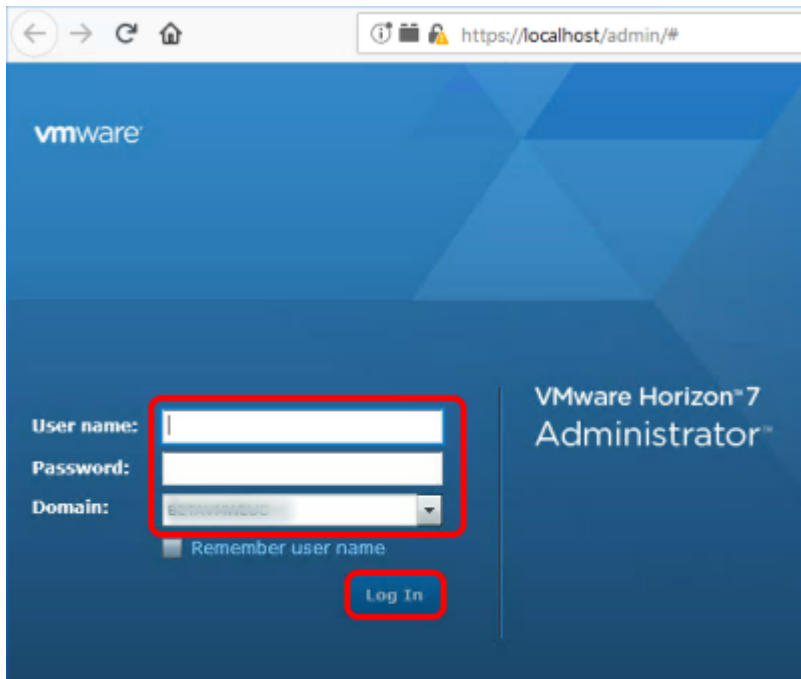

Launch Horizon Administrator using one of the following methods:

- If you are logged in to the server on which you installed the Connection Server, double-click the desktop icon.
- If you are accessing Horizon Administrator from a machine other than the one you used for installation, open a browser and enter the following URL:

`https://<connection-server-name>/admin`.

## 14. Log in to Horizon Administrator

Log in to Horizon Administrator using an account that belongs to the user or group account you specified in [Specify the User or Group Who Will Have Full Administrative Privileges](#).

For more information about installation and all the options, see the [Horizon 7 Installation](#) guide.

# Set Up the Composer Database

The Composer database stores information about connections and components that are used by the Composer:

- vCenter Server connections
- Active Directory connections
- Linked-clone desktops that are deployed by the Composer
- Replicas that are created by the Composer

**Note:** If you choose to use instant clones in your enterprise rather than linked clones, no database is required for instant clones.

## Prerequisites for Setting Up the Composer Database

To perform this exercise, you need the following:

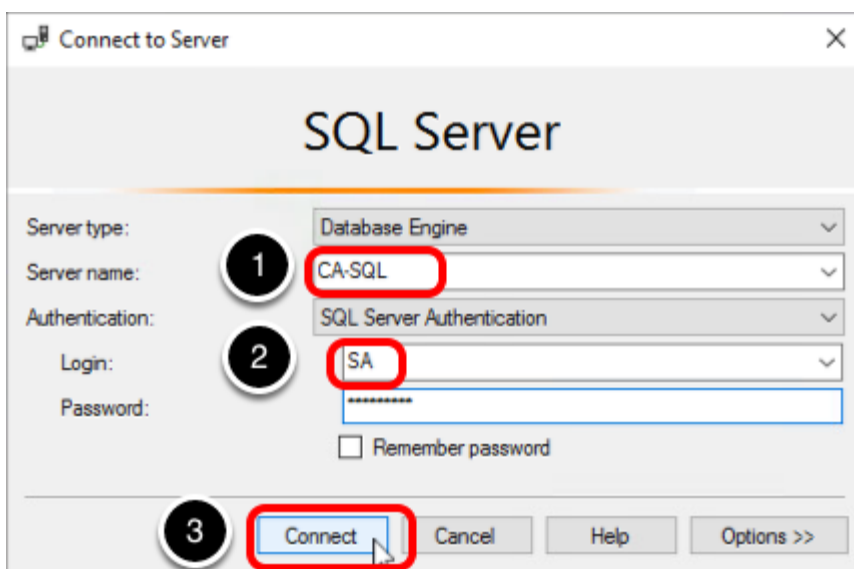

- **SQL Server instance** – This is the database server on which you will create the Composer database. For the example in this exercise, we used Microsoft SQL Server 2016. To simplify the setup for completing this tutorial in a lab setup, we recommend that you use the same SQL Server instance for the Composer database, the event database, and the JMP server database. For a list of databases that support all three of these components, see the product documentation topic [Database Requirements for JMP Server](#).  
**Tip:** If you performed the exercise [Create VMs for the Connection Server and Composer](#), you can also clone a VM for your SQL Server instance.
- **Microsoft SQL Server Management Studio** – For the example in this exercise, we used Microsoft SQL Server Management Studio v17.7. The instructions might differ slightly for different versions of SQL Server Management Studio.
- **SA credentials** – To create the necessary logins for the Composer server database, you will log in to the SQL Server instance as the sysadmin (SA) or as a user account with SA privileges.

## 1. Open Microsoft SQL Server Management Studio

1. On the VM where SQL Server and SQL Server Management Studio are installed, click the Start button.
2. Navigate to and select Microsoft SQL Server Management Studio.

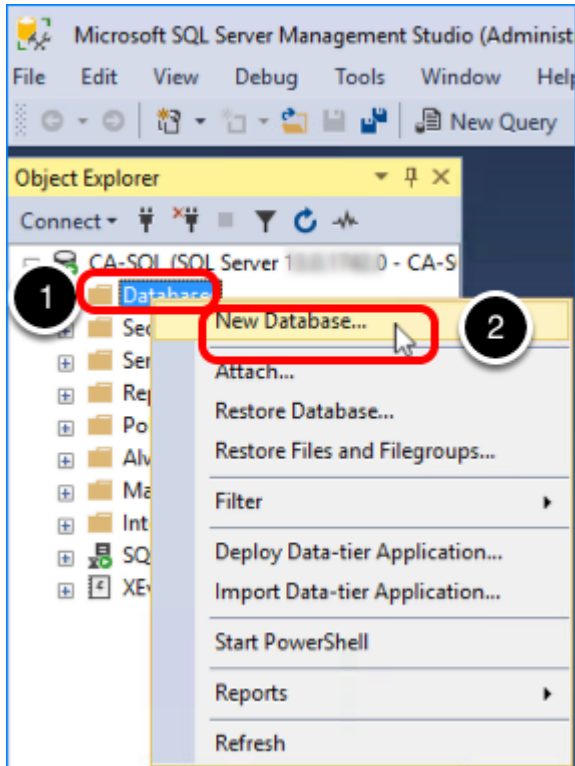

## 2. Log In to a SQL Management Studio Session as SA

1. Select SQL Server instance. By default your Windows login credentials are used, but you are not required to use Windows authentication.
2. Log in as the sysadmin (SA) or using a user account with SA privileges.

3. Click Connect.

### 3. Create a Database for the Composer Server

1. In the Object Explorer, right-click Databases.
2. Select New Database.

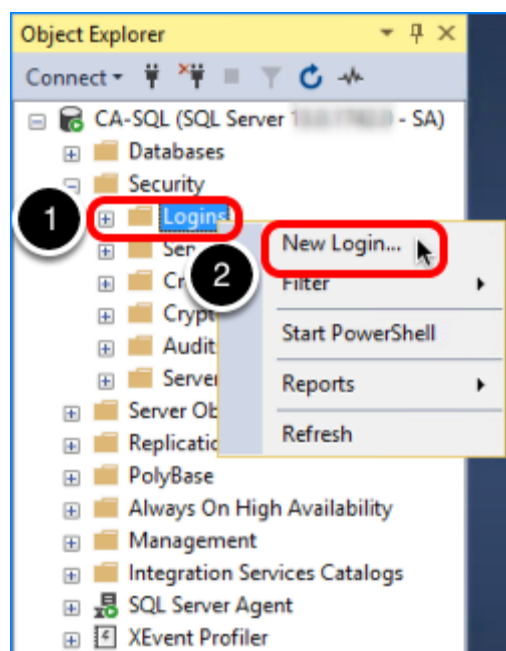

## 4. Name the Composer Database

1. For the database name, enter `ComposerDB`. You must use only ASCII characters. Use the default settings.
2. Click OK.

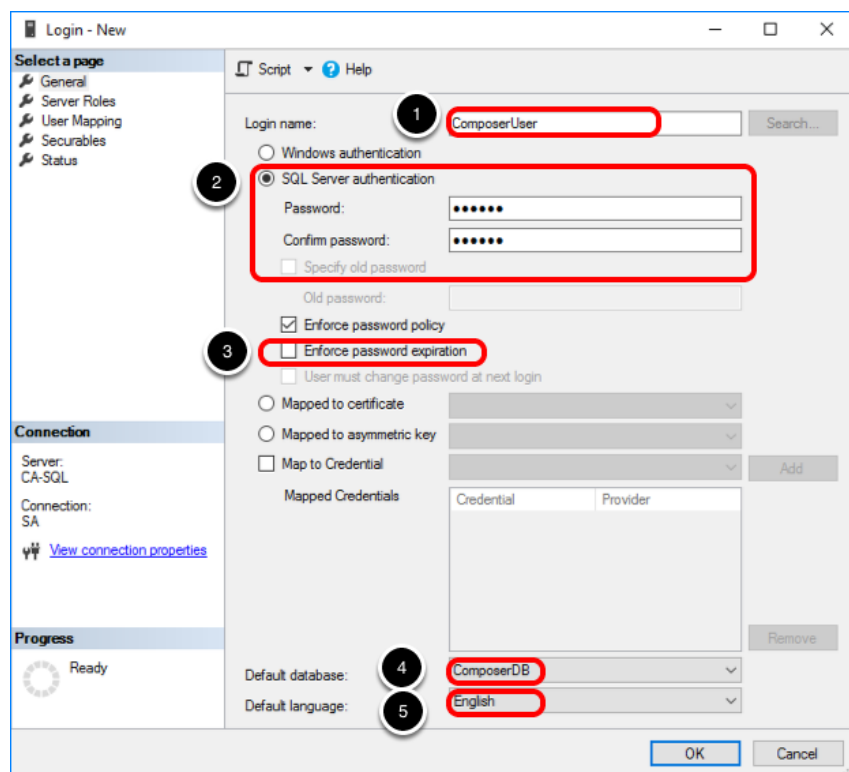

The new database is added under the **Databases** folder in the Object Explorer pane.

## 5. Create a Database Login for the Composer Server

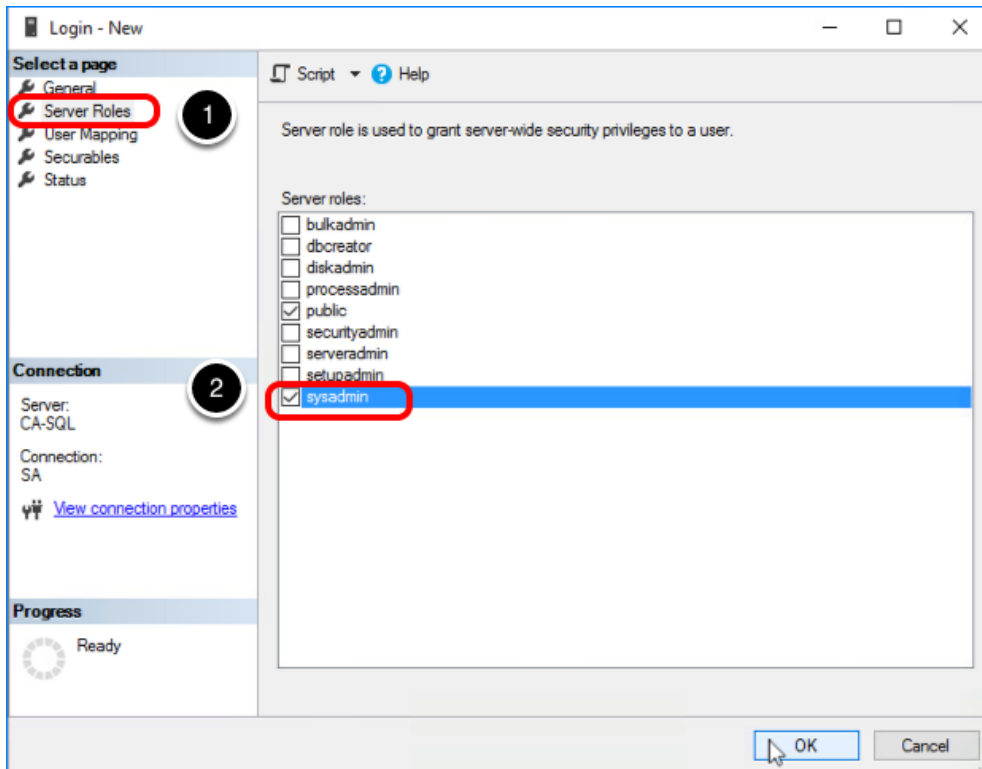

1. Expand the Security folder, and right-click Logins.
2. Select New Login.

## 6. Complete the General Settings

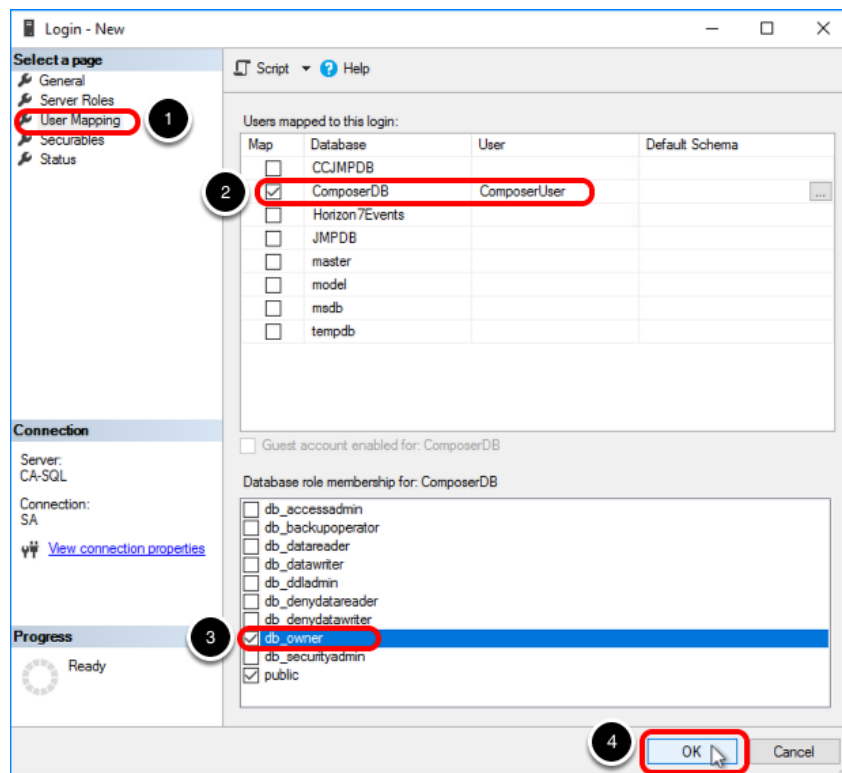

1. Enter a login name, using ASCII characters only; for example, `ComposerUser`.
2. Select SQL Server authentication, and create a password.
3. De-select Enforce password policy. For the purposes of this exercise, you do not need to use password policies.
4. Set the default database to the Composer database.
5. Select a default language.

## 7. Assign the sysadmin Server Role

1. Select the Server Roles page.
2. Select the sysadmin check box.

## 8. Complete the User Mapping Settings

1. Select the User Mapping page.
2. Select the ComposerDB database.
3. Select the db\_owner role.
4. Click OK.

The new login is added under the Security > Logins folder in the Object Explorer pane.

# Install the Composer

Horizon 7 uses Composer, also called View Composer, to create and deploy linked-clone desktops in vCenter Server. Composer is the legacy method of optimizing your use of storage space and facilitate updates.

(Instant-clone desktops, another feature, improve and accelerate the process of cloning virtual desktops, and use even less storage and administrative effort, because the desktop is deleted when the user logs out. Both instant-clone and linked-clone desktops are explored in other chapters of this tutorial.)

Installing Composer is required only if you plan to do the exercises for creating linked-clone desktops. For production environments, VMware recommends using instant clones rather than linked clones.

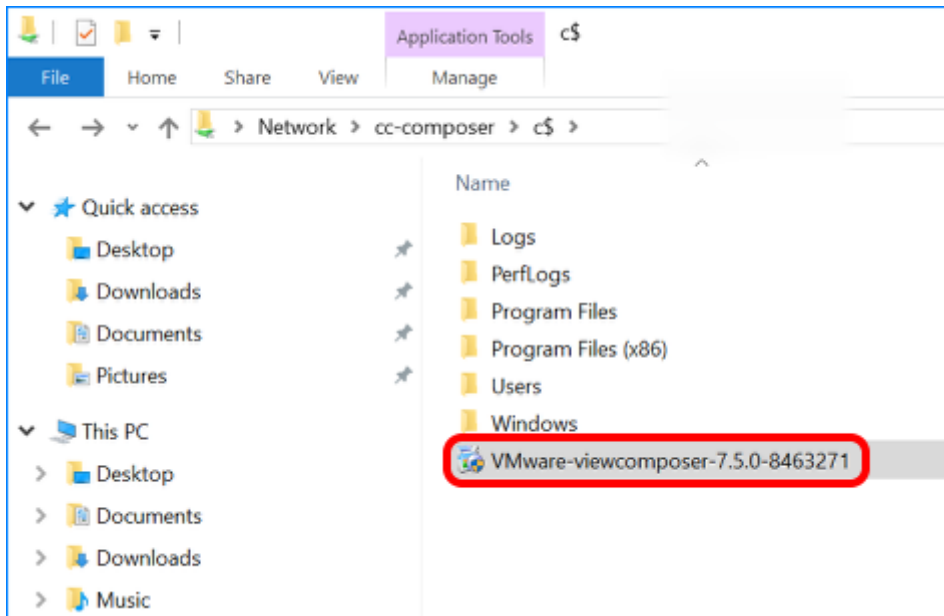

**Note:** Do not install Composer on the same virtual or physical machine as Connection Server, Horizon Agent, Horizon Client, or other Horizon 7 software components. For this exercise, Composer is installed on a standalone machine.

## Prerequisites for Composer Installation

To perform this exercise, you will need the following:

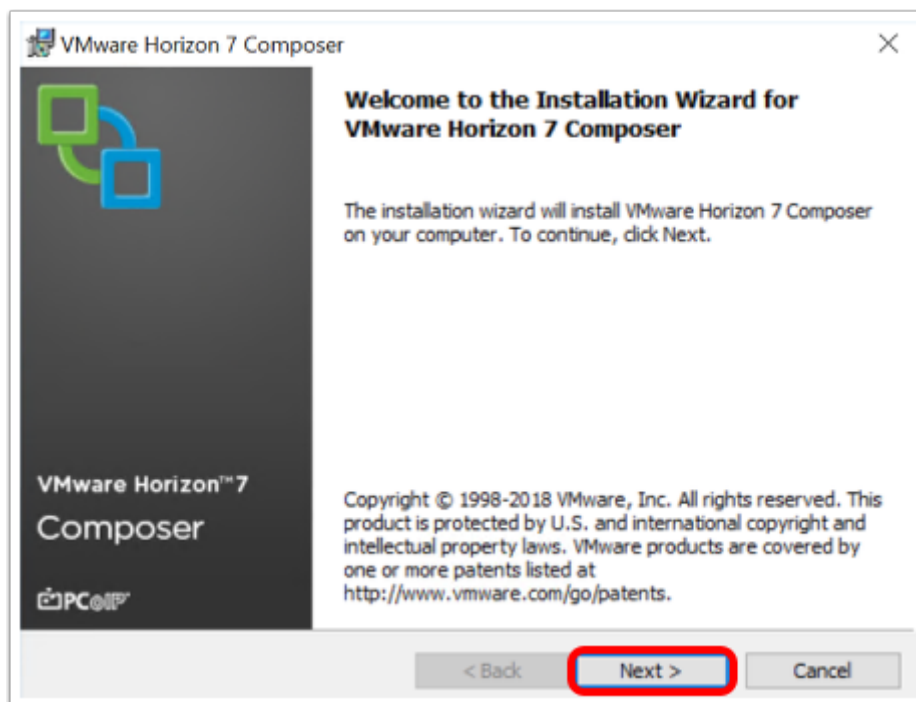

- **Database** – Verify that you have performed all the steps in the exercise [Set Up the Composer Database](#), which include creating the database for storing Composer information and a login user with the correct privileges for the Composer server to communicate with the database.
- **SQL Server Native Client 11** – If the driver for the native client is not already installed on the Composer server machine, you can download the installer, which is called `sqlncli.msi` and is one of the components included in the [Microsoft SQL Server 2016 Feature Pack](#). You will select this driver when you are completing the Composer installation wizard.
- **User account for running the installer** – When you log in to the OS to run the installer, the account you use must have administrative privileges.
- **Installer** – If necessary, you can download the installer from the [Download VMware Horizon](#) page or the [VMware Horizon 7 Product Evaluation Center](#). You must download and copy the installer file to the Composer server VM, or, alternatively, you can copy it to a location accessible to the system.
- **VM that satisfies virtual hardware requirements** – If you performed the exercise [Create VMs for the Connection Server and Composer](#), you have an appropriate VM. If you did not perform that exercise, make sure that the VM you have adheres to the specifications listed in the product documentation topic [Hardware Requirements for Standalone View Composer](#).
- **Windows OS** – The system must be running a supported Windows version. We recommend Windows Server 2016. for a complete list of supported operating systems, see the product documentation topic [Supported Operating Systems for View Composer](#).

## 1. Run the Composer Installer

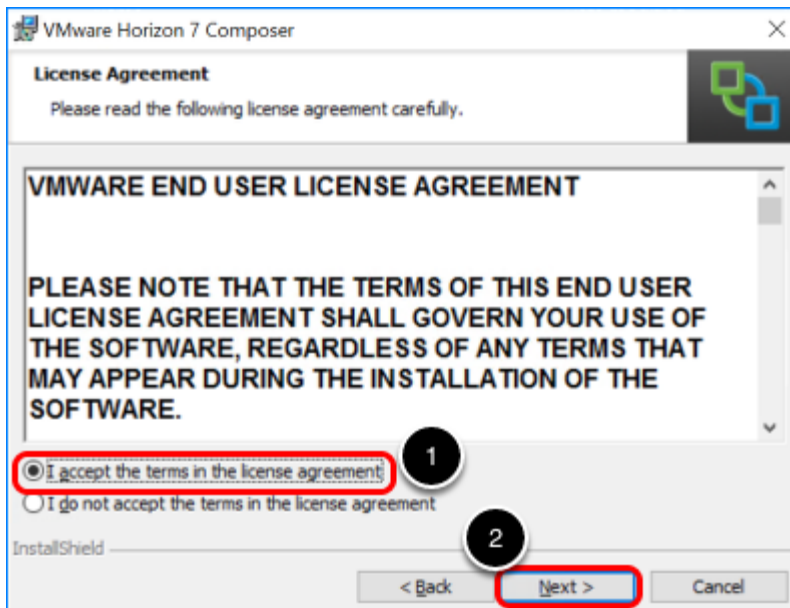

Navigate to the Composer installation file that you downloaded earlier, and double-click the file to start the installation wizard.

## 2. Click Next on the Welcome Page

On the installation wizard Welcome page, click Next.

### 3. Accept the License Agreement

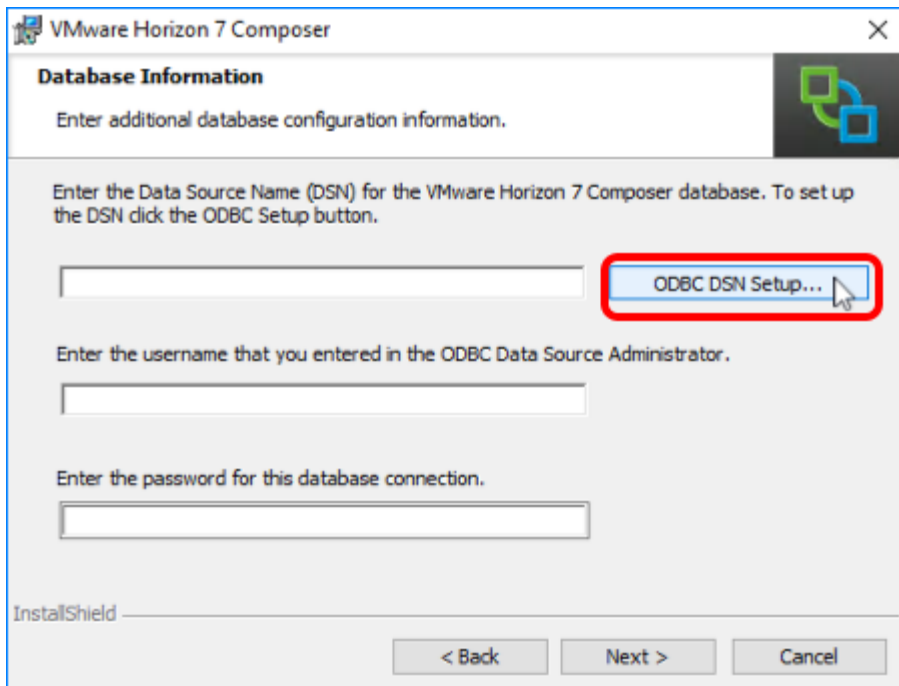

1. Select I accept the terms in the license agreement.
2. Click Next.

### 4. Accept the Default Installation Directory

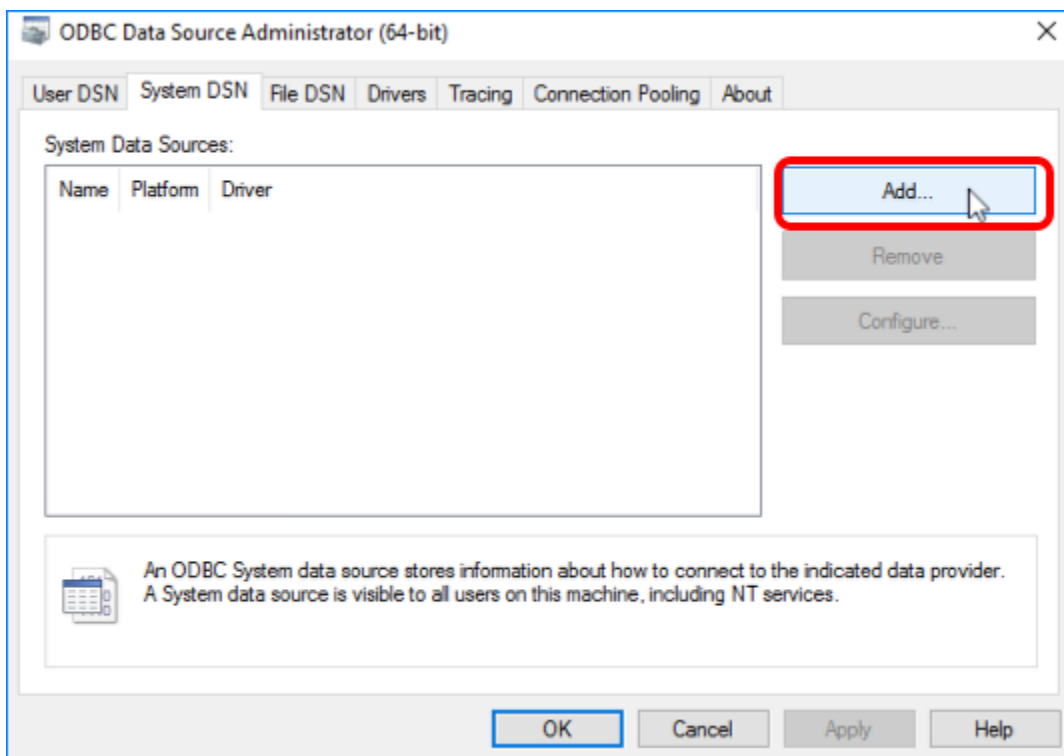

Click Next.

## 5. Set Up a New ODBC Data Source

Click ODBC DSN Setup.

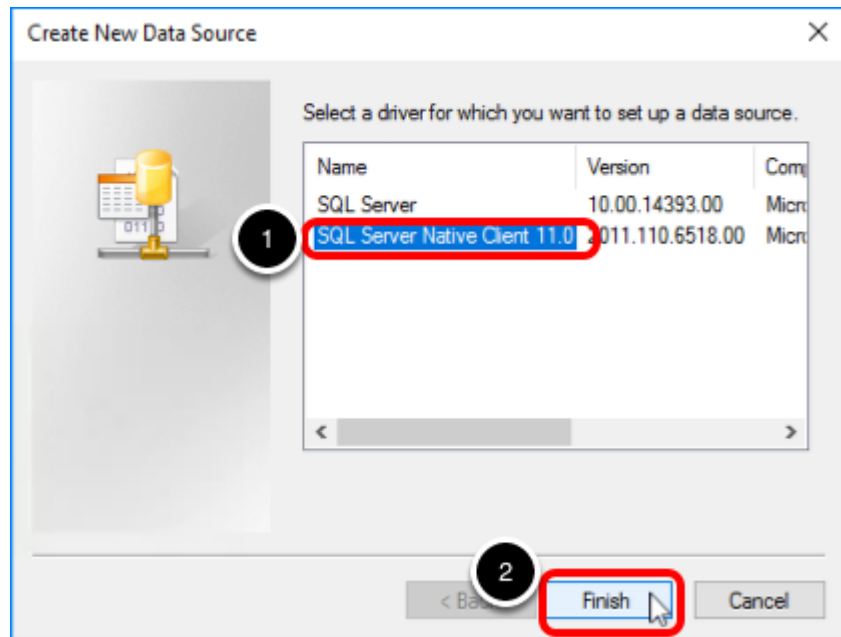

## 6. Add a New System DSN

Click Add.

## 6.1. Select the SQL Server Native Client

1. Select SQL Server Native Client 11. If you do not see a driver for the native client, you can download the installer, which is called `sqlncli.msi` and is one of the components included in the [Microsoft SQL Server 2016 Feature Pack](#).
2. Click Next.

## 6.2. Enter Data Required to Create a Data Source

Create a New Data Source to SQL Server

This wizard will help you create an ODBC data source that you can use to connect to SQL Server.

What name do you want to use to refer to the data source?

1 Name: Composer-data-source

How do you want to describe the data source?

Description:

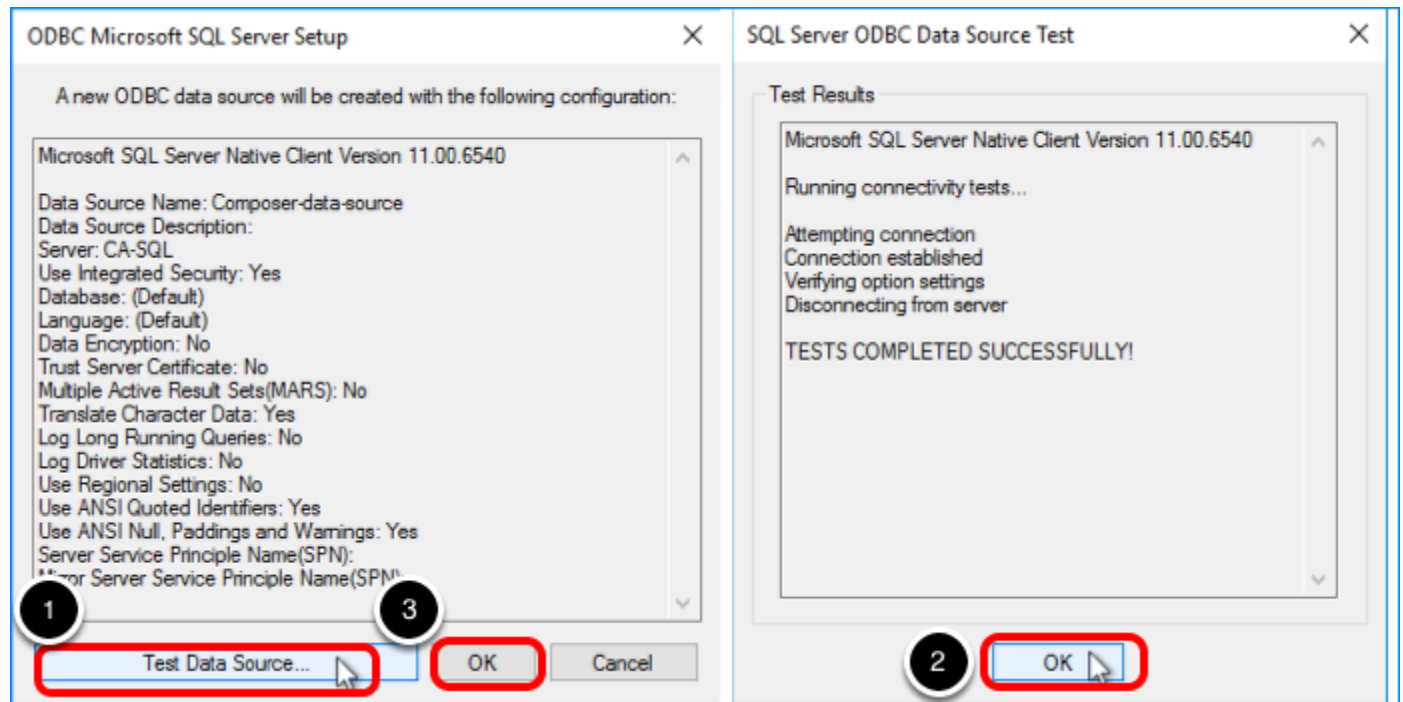

Which SQL Server do you want to connect to?

2 Server: CA-SQL

3 Finish Next > Cancel Help

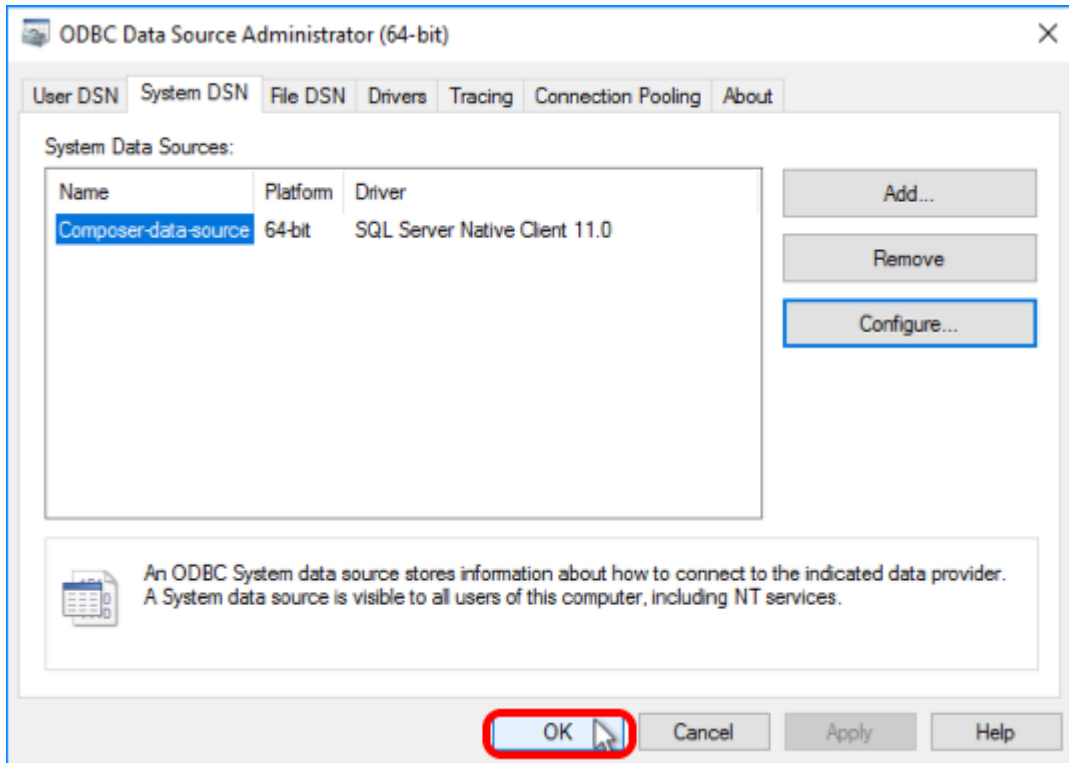

1. Enter a name for the data source; for example, `Composer-data-source`.
2. Select the database server instance from the drop-down list.
3. Click Finish.

## 6.3. Test the Data Source Connection

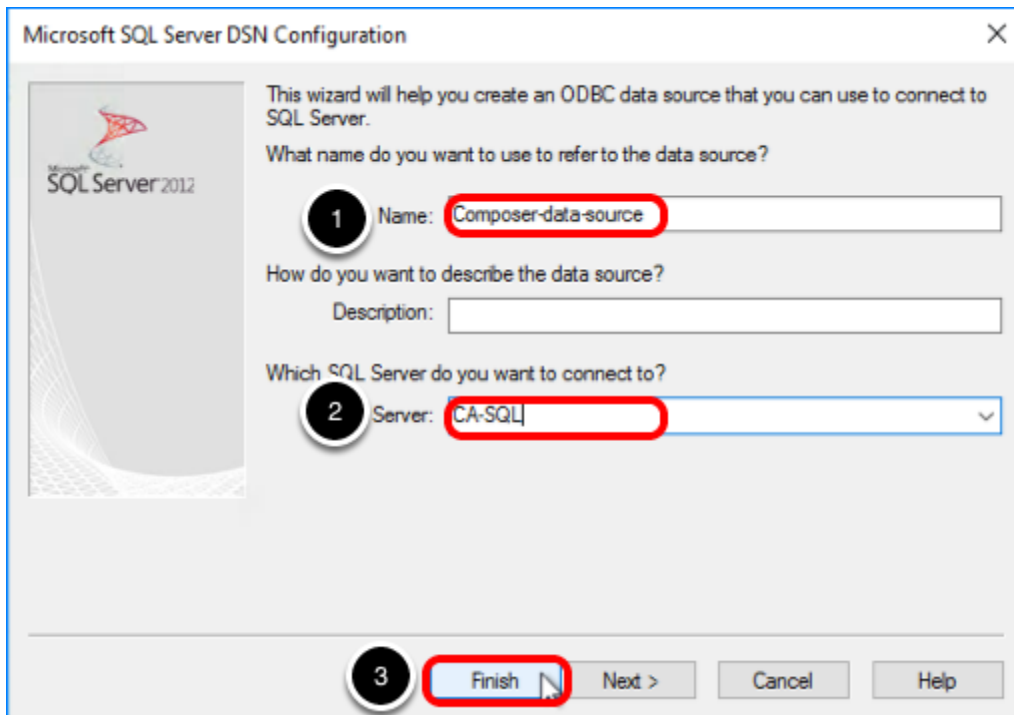

1. Click Test Data Source.
2. Click OK in the Test Results window.
3. Click OK in the ODBC data source window.

## 6.4. Click OK in the Data Source Administrator

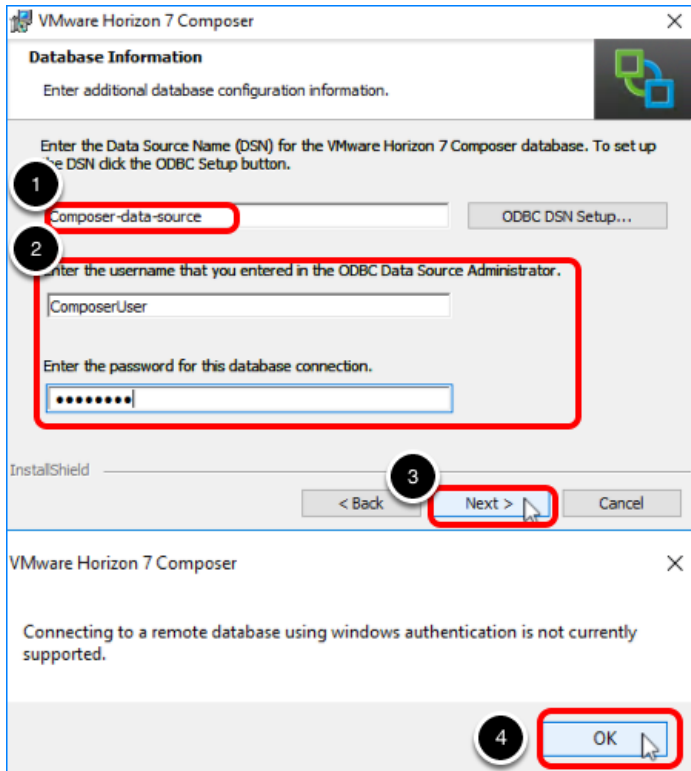

Now that the data source for the Composer database has been added, click OK to close the ODBC Data Source Administrator wizard.

## 6.5. Configure the Data Source

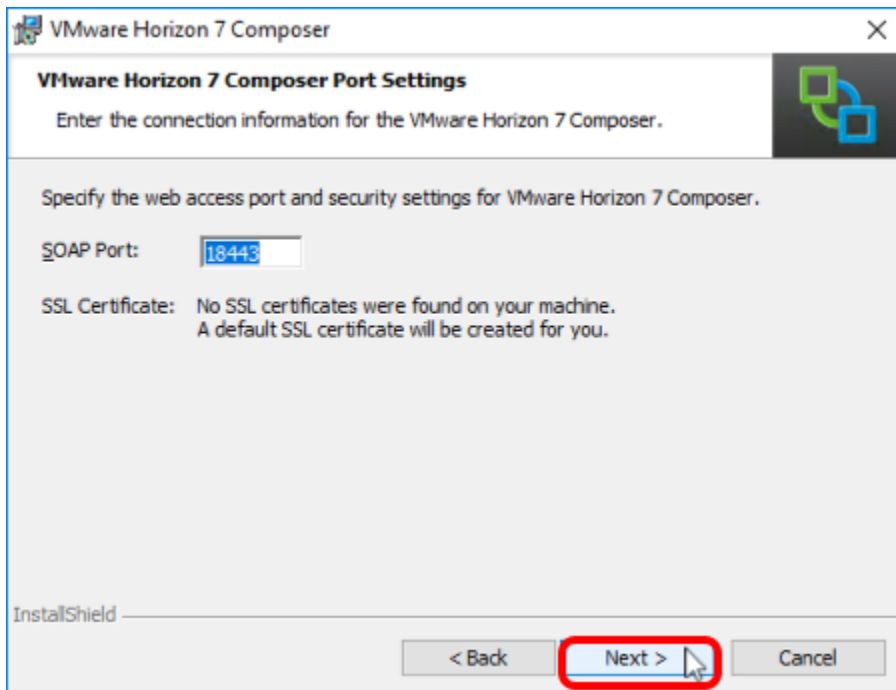

1. Add a name; for example, enter `Composer-data-source`.
2. Select the SQL Server from the drop-down list.
3. Click Finish.

## 7. Enter Database Information

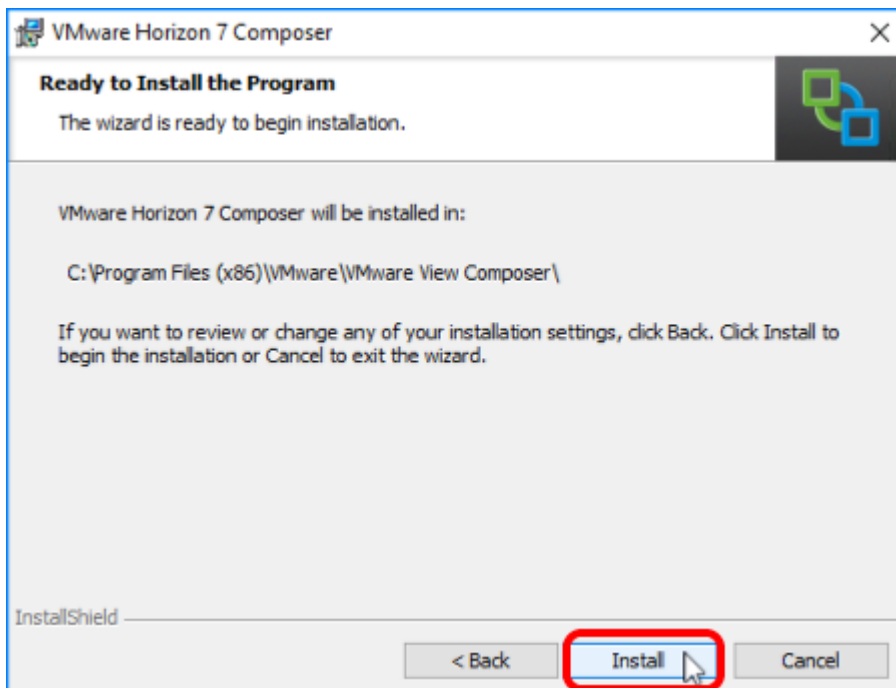

1. Now that a data source is configured, enter the data source name; for example, Composer-data-source.
2. Enter the user name and password for the login you created in the exercise [Set Up the Composer Database](#).
3. Click **Next**.
4. Click **OK**. You can safely ignore this warning because the user you created uses SQL Server authentication rather than Windows authentication.

## 8. Accept the Default SOAP Port

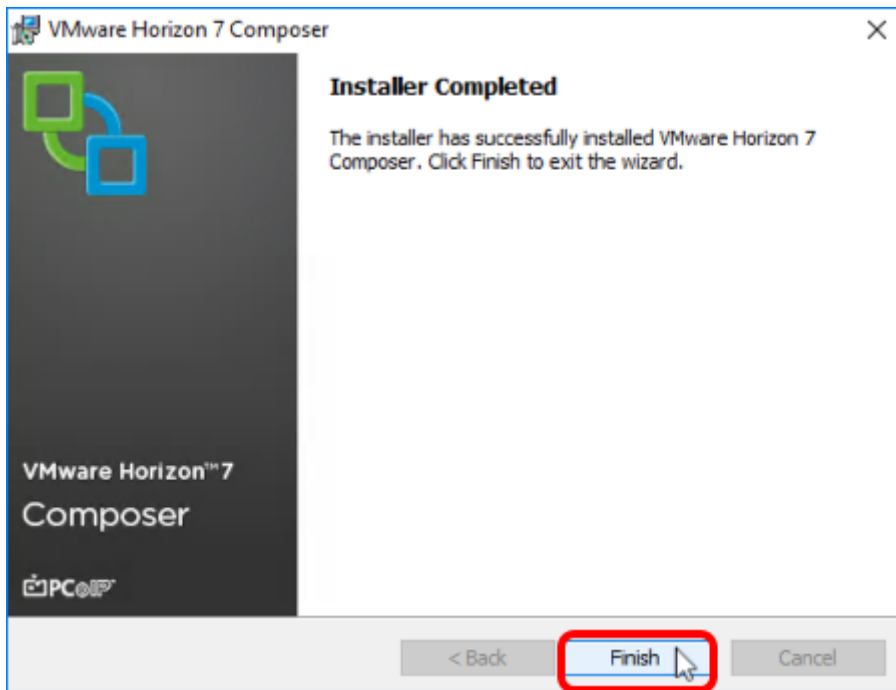

Click Next.

## 9. Start the Installation Process

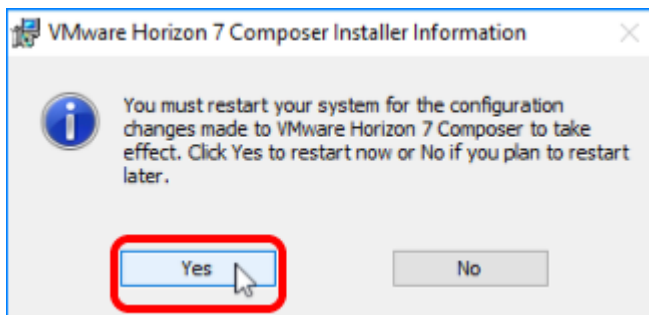

Click Install.

## 10. Click Finish

When installation is complete, click **Finish** to close the wizard.

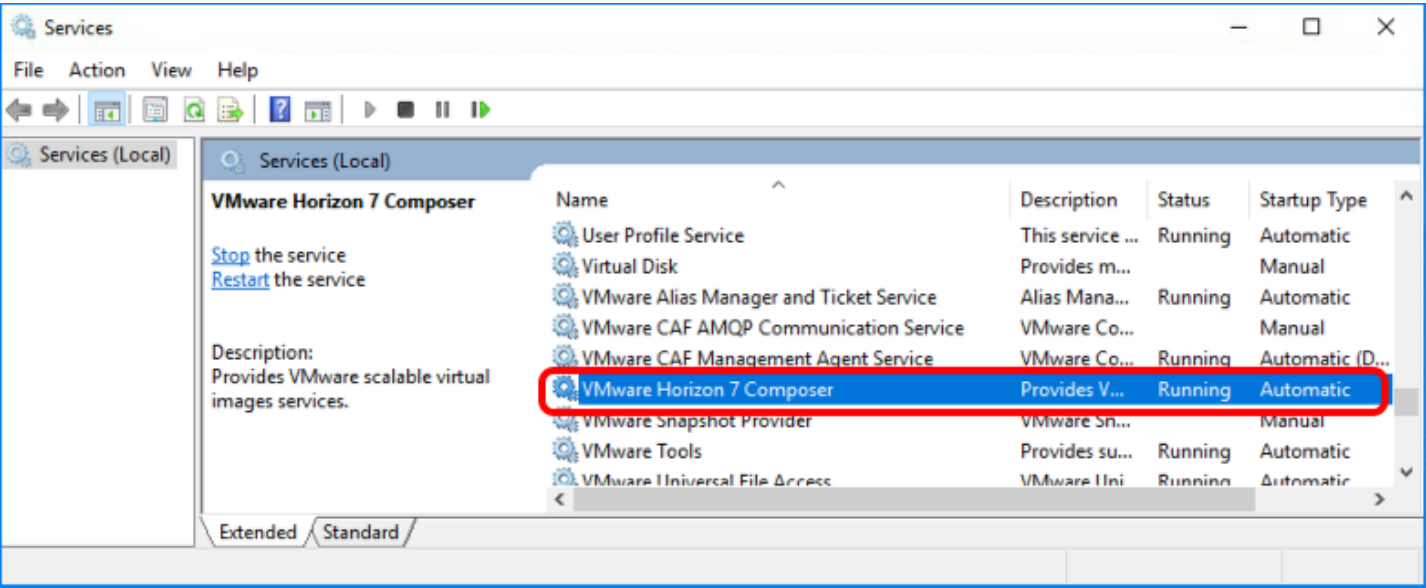

## 11. Restart the System

To finalize the installation, click **Yes** to reboot the virtual machine.

# 12. Verify that the Service Is Started

On the Composer VM, open the Services applet, and verify that the **VMware Horizon 7 Composer** service is running.

# Initial Configuration

# Introduction

The exercises in this chapter are about configuring the Connection Server so that it can create pools of VDI desktops and RDSH-published desktops and applications. You use the Horizon Administrator UI to perform these Connection Server configuration tasks. In subsequent chapters, you will use the new Horizon Console UI to create and monitor desktop and application pools.

Some exercises in this chapter are mandatory, and some are optional. For example, the exercise [Create a Domain User Account and OUs in AD for Clone Operations](#), is optional in that you are not required to create a new domain user account and new Active Directory organizational units if you just want to set up a proof-of-concept (POC) environment. When prompted in later exercises, you can specify an existing domain user and OUs if you like.

Similarly, you are not required to set up an event database. The event database allows you to monitor logging operations in the Horizon Administrator UI. If you do not complete the exercise [Create an Event Database](#), you can instead look directly in the log files if necessary, or you can configure logs to be sent to a Syslog server.

If you do not perform these optional exercises, configuring the Connection Server involves only three tasks: entering the license key, adding a vCenter Server, and designating an instant-clone domain administrator.

# Create a Domain User Account and OUs in AD for Clone Operations

In this exercise, you perform the following preliminary tasks so that instant- or linked-clone desktops can be automatically joined to a specified domain as they are created:

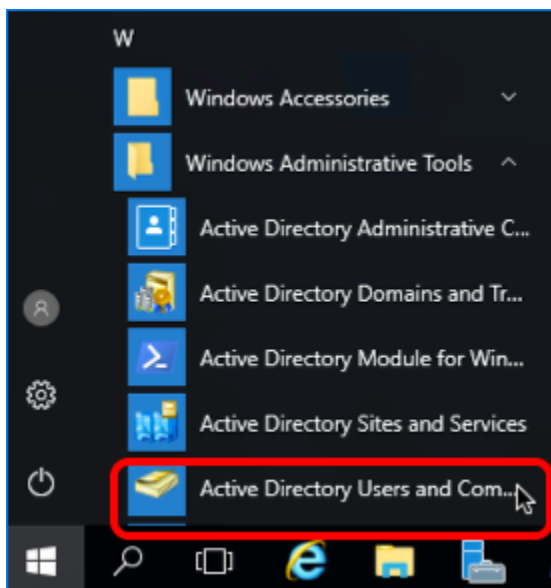

- Create a user account in Active Directory that has the required permissions for creating and deleting cloned-desktops.
- Create one organizational unit (OU) in Active Directory for instant-clone desktops, another for instant-clone RDSH servers, and another OU for linked-clone desktops.

**Note:** This exercise shows how you would typically create an OU in a production environment and set the minimum required Active Directory domain privileges. However, for a test environment, you can skip this exercise and deploy the instant-clone and linked-clone virtual machines (VMs) to the Computers OU, and use a domain administrator account for the instant-clone domain administrator and the domain administrator for View Composer.

## Prerequisites for Creating OUs and the Domain Admin

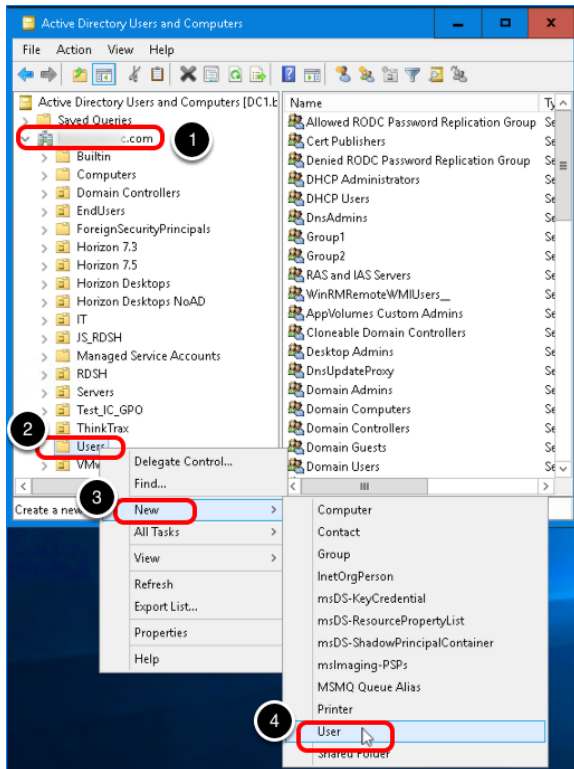

To perform this exercise, you must have a user account for logging in to the domain controller as an administrator and creating users and OUs in Active Directory.

### 1. Open Active Directory Users and Computers

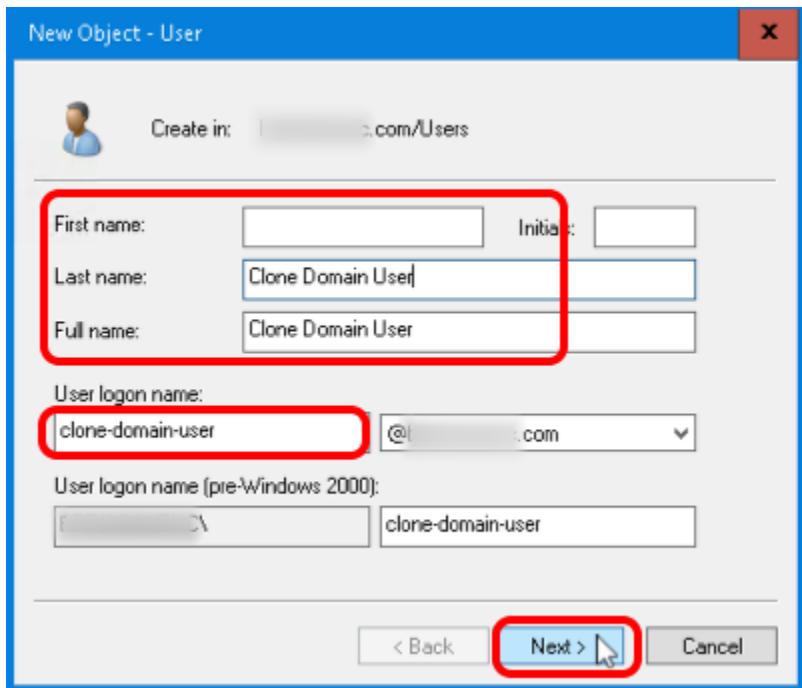

On the Active Directory Domain Controller, log in as an administrator, and go to Start button > Administrative Tools > Active Directory Users and Computers.

## 2. Add a New User

1. Expand the domain.
2. Right-click Users.
3. Select New.
4. Select User.

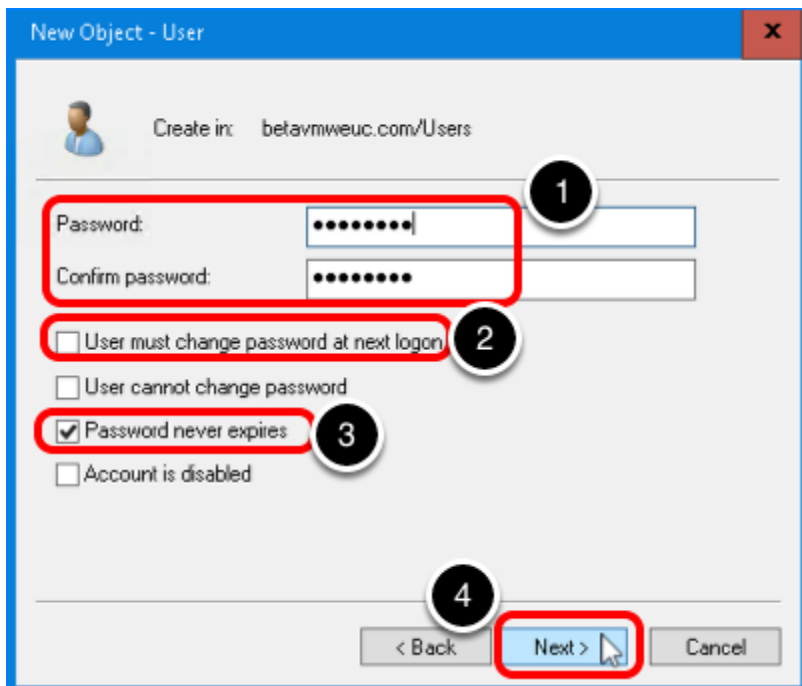

## 2.1. Enter User Name Information

The screenshot shows the 'New Object - User' dialog box. The 'Create in' field is set to 'betavmweuc.com/Users'. The 'First name' field is empty, and the 'Initials' field is empty. The 'Last name' field contains 'Clone Domain User'. The 'Full name' field contains 'Clone Domain User'. The 'User logon name' field contains 'clone-domain-user', and the domain dropdown is set to 'betavmweuc.com'. The 'User logon name (pre-Windows 2000)' field contains 'clone-domain-user'. The 'Next >' button is highlighted with a red box and a mouse cursor.

Complete the dialog box, and click Next.

## 2.2. Enter Password Information

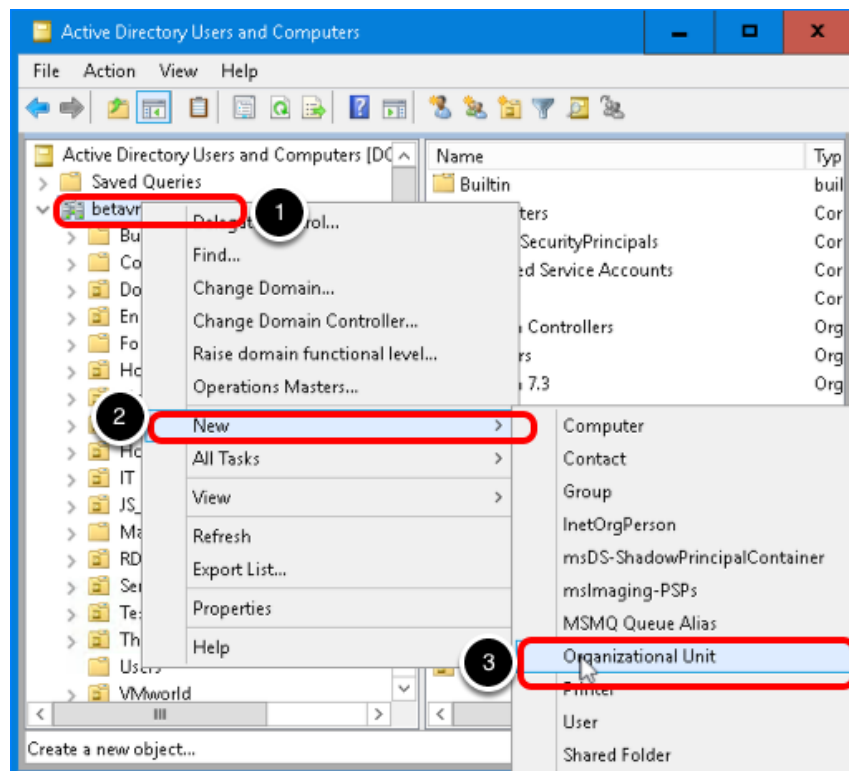

The screenshot shows the 'New Object - User' dialog box. The 'Create in' field is set to 'betavmweuc.com/Users'. The 'Password' field contains '\*\*\*\*\*', and the 'Confirm password' field contains '\*\*\*\*\*'. The 'User must change password at next logon' checkbox is unchecked. The 'User cannot change password' checkbox is unchecked. The 'Password never expires' checkbox is checked. The 'Account is disabled' checkbox is unchecked. The 'Next >' button is highlighted with a red box and a mouse cursor. Numbered callouts 1 through 4 are present: 1 points to the Password field, 2 points to the 'User must change password at next logon' checkbox, 3 points to the 'Password never expires' checkbox, and 4 points to the 'Next >' button.

1. Enter a password.

2. De-select **User must change password at next logon**. In a test environment, you can de-select this check box.
3. Select **Password never expires**. In a test environment, you can select this check box.
4. Click **Next**, and click **Finish** in the next wizard page to close the wizard and create the user.

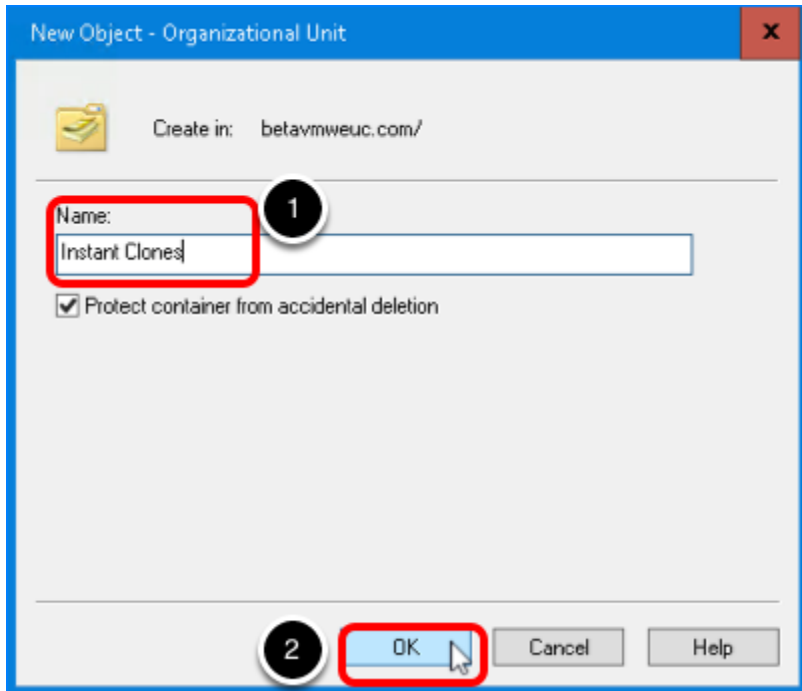

Now that you have a domain user account to use specifically for creating cloned VMs, you can add this user to the Active Directory OUs that will contain the VM computer accounts, as described in the steps that follow. You will also assign permissions to this user so that the user account can create and delete VMs in the OUs.

### 3. Create an OU for Instant-Clone Desktops and Delegate Control

1. Right-click the domain.
2. Select **New**.
3. Select **Organizational Unit**.

### 3.1. Name the OU

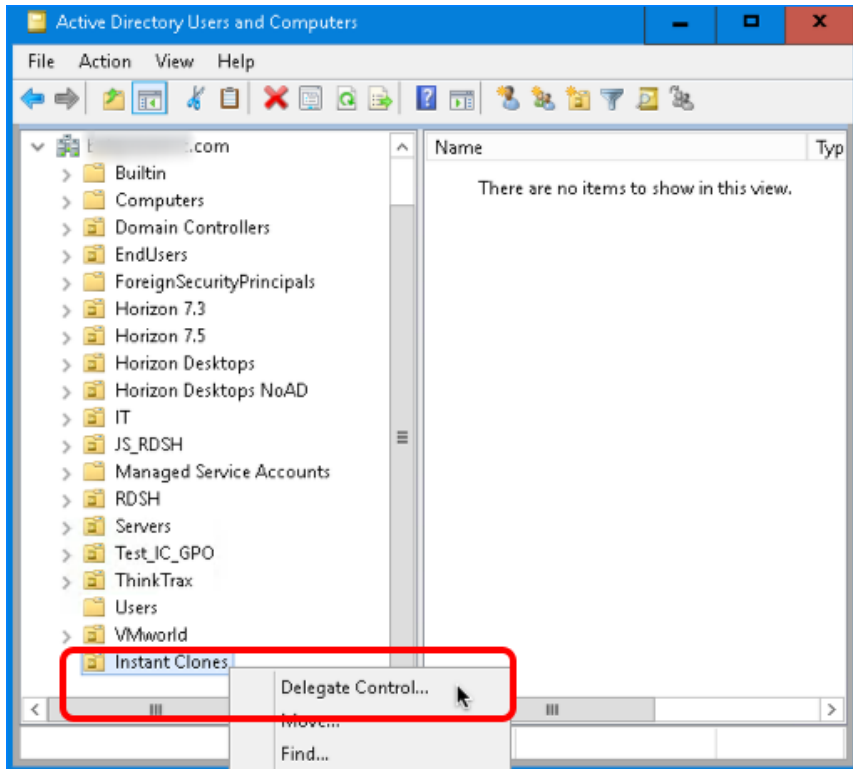

1. Enter a name; for example, `Instant Clones`.
2. Click OK.

This OU is the Active Directory container in which the instant-clone computer accounts will be created. After you complete the text box, you can find the OU under the domain.

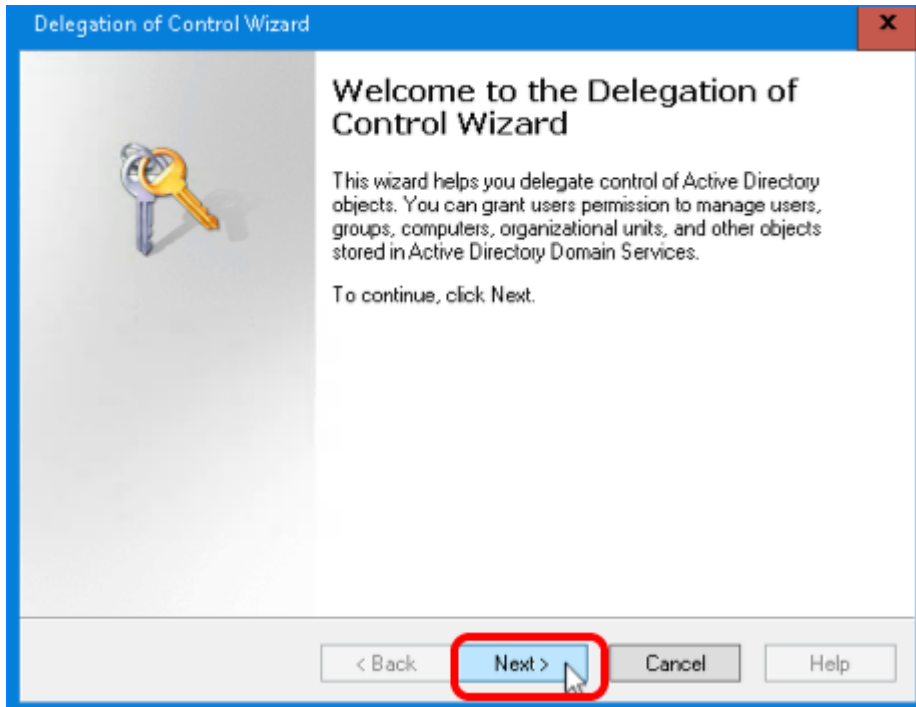

## 3.2. Open the Delegation of Control Wizard

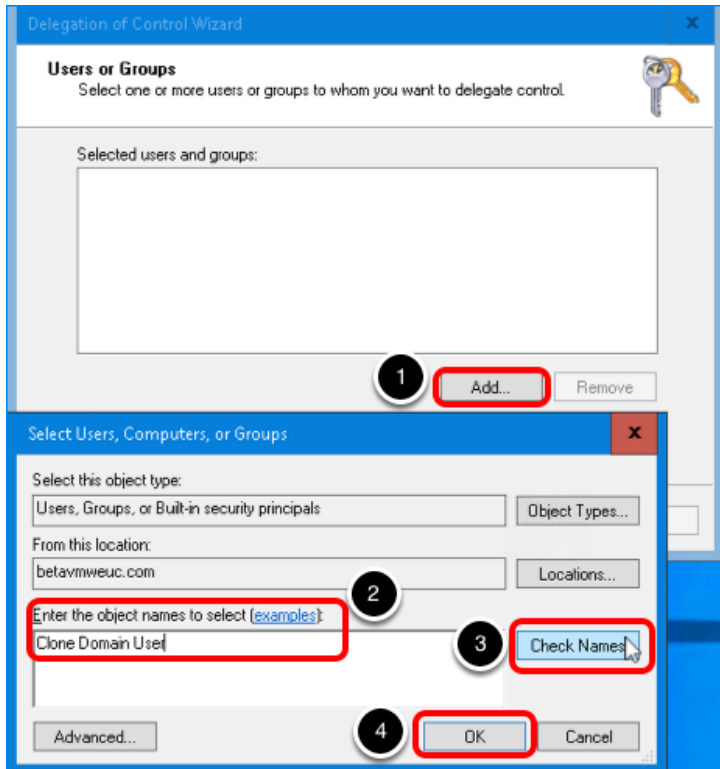

Right-click the OU you created (that is, the container) and select **Delegate Control**.

### 3.3. Click Next on the Welcome Page

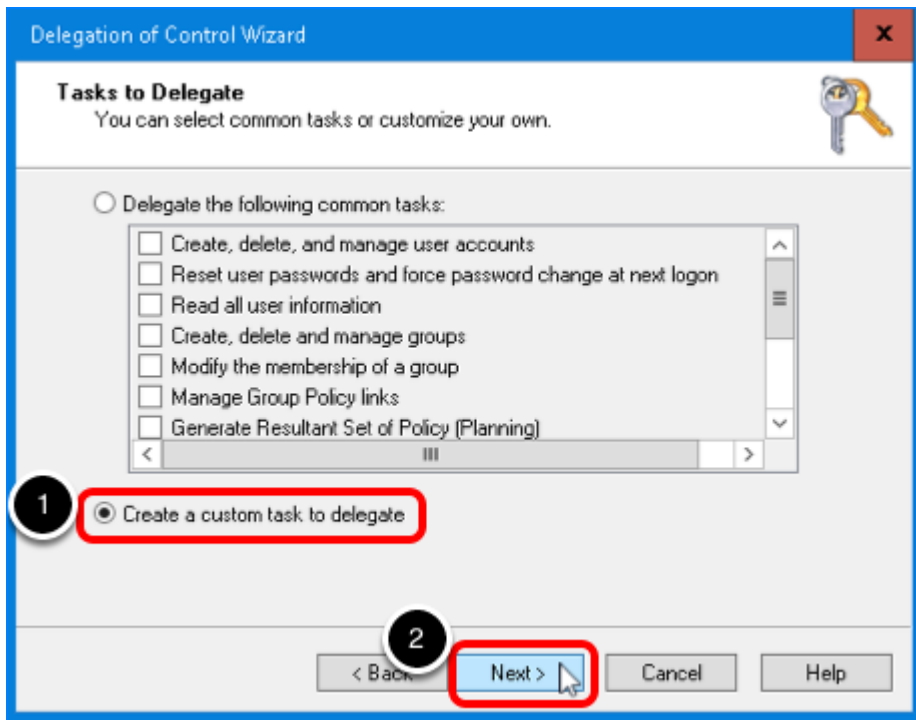

Click **Next** to start the wizard.

## 3.4. Add the Domain User

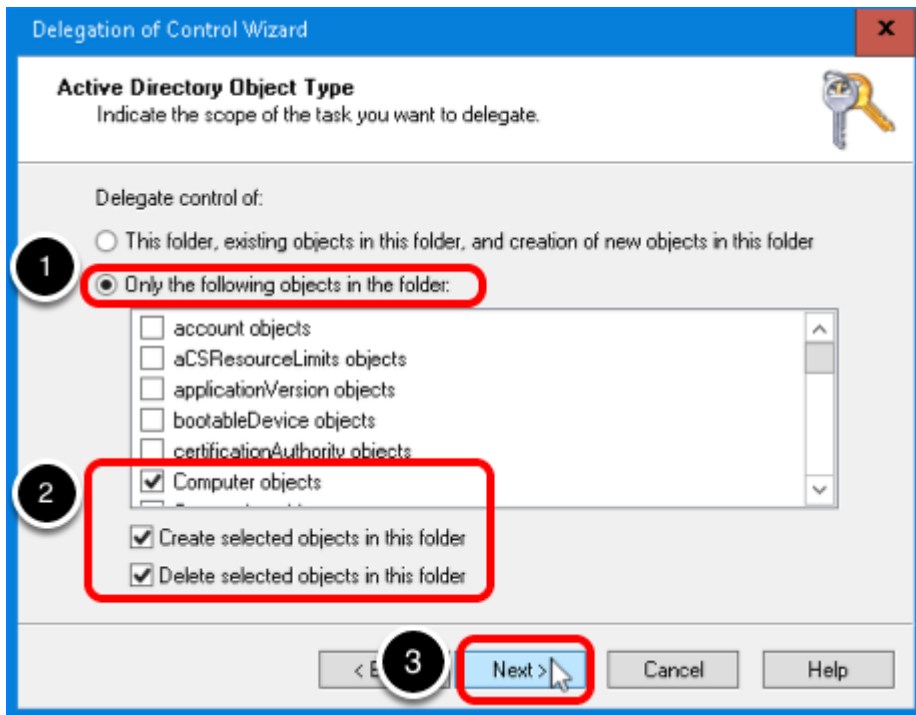

1. In the Users or Groups dialog box, click **Add**.
2. Enter the name of the domain user you just created; for the example in this exercise, we use `Clone Domain User`.
3. Click **Check Names** to verify that the name can be found in Active Directory.
4. Click **OK**.
5. When you are returned to the Users or Groups page, click **Next**.

### 3.5. Create a Custom Task to Delegate

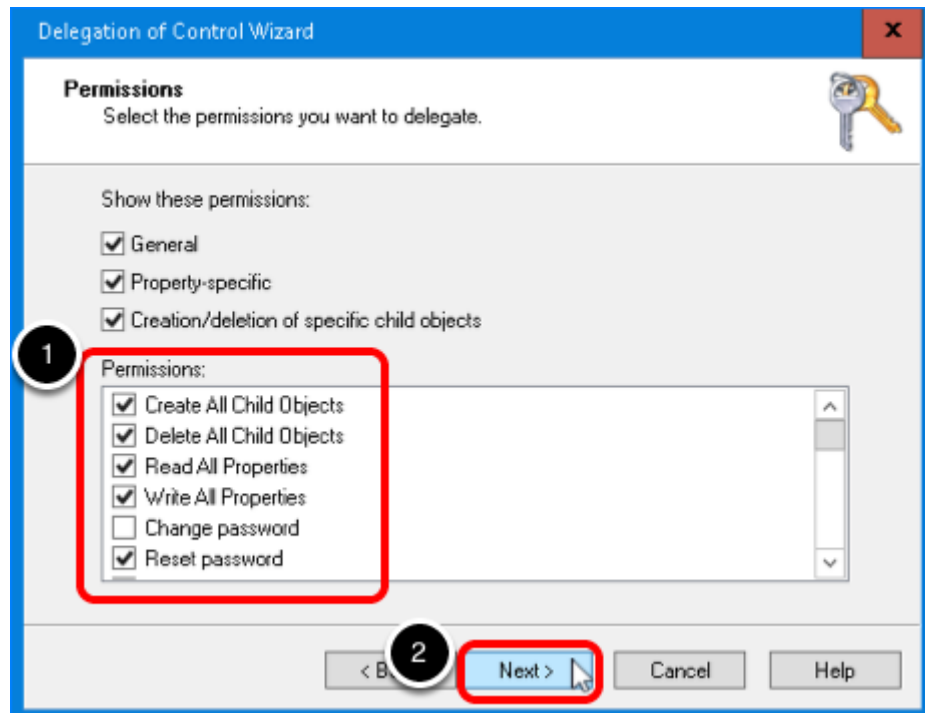

1. Select Create a custom task to delegate.
2. Click Next.

## 3.6. Delegate Control of Computer Objects

1. Select Only the following objects in the folder.
2. Select the following check boxes:
  - Computer objects
  - Create selected objects in this folder
  - Delete selected objects in this folder
3. Click OK.

## 3.7. Select Permissions

1. in the Permissions list, select the following items:

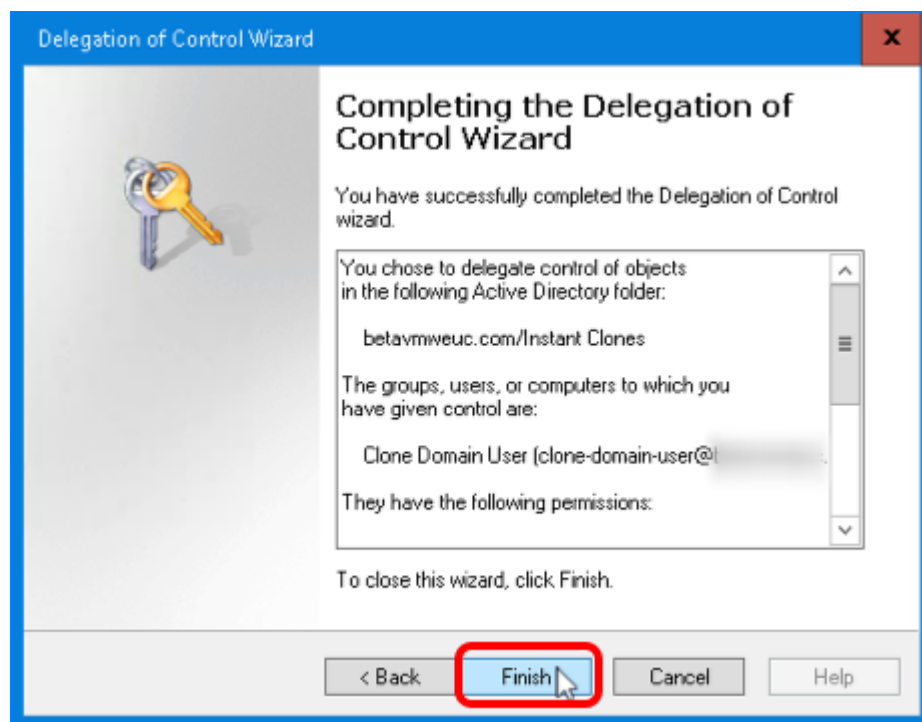

- Create All Child Objects
- Delete All Child Objects
- Read All Properties
- Write All Properties
- Reset Password

2. Click Next.

These are the required permissions for the user account, including permissions that are assigned by default.

- List Contents
- Read All Properties
- Write All Properties
- Read Permissions
- Reset Password
- Create Computer Objects
- Delete Computer Objects

### 3.8. Click Finish

Click Finish to close the wizard.

## 4. Create an OU for Instant-Clone RDSH Servers and Delegate Control

If you plan to perform the exercise for creating an instant-clone farm of RDSH servers, repeat the step [Create an OU for Instant-Clone Desktops and Delegate Control](#) to create an OU for the instant-clone RDSH server computer accounts. You might name the OU **RDSH Servers**.

## 5. Create an OU for Linked Clones and Delegate Control (Optional)

If you plan to perform the exercise for using the Composer and creating a linked-clone desktop pool, repeat the step [Create an OU for Instant-Clone Desktops and Delegate Control](#) to create an OU for linked-clone desktop computer accounts. You might name the OU **Linked Clones**. The OUs for linked clones require the same delegation permissions as those for instant clones.

**Note:** In a production environment, usually the decision is made to use either linked clones or instant clones.

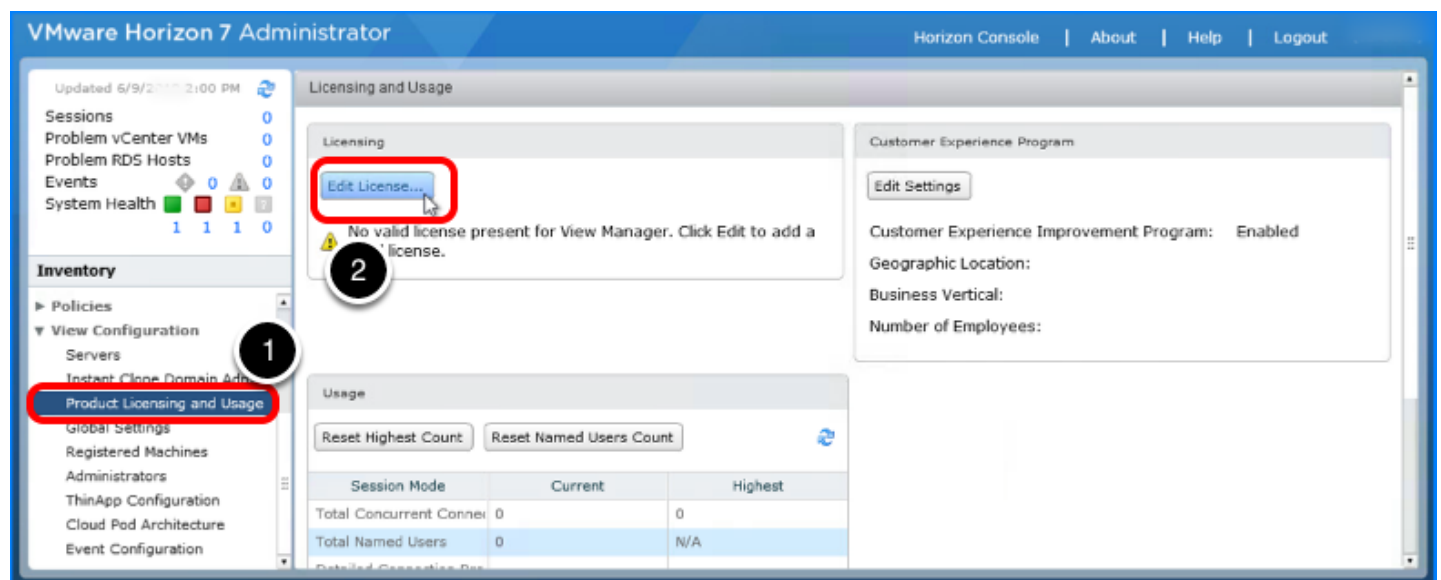

# Add the Product License Key

The first step of initial configuration after installing the Connection Server is to add a product license key. The first time you log in to the Connection Server, the Horizon Administrator opens to the Product Licensing and Usage page.

## Prerequisites for Adding a License

Before you perform this exercise, you need a valid license. You can use an evaluation license. For information about purchase options, see the [VMware End-User Computing Packaging and Licensing](#) guide.

### 1. Click the Edit License Button

1. In Horizon Administrator, navigate to View Configuration, and select Product Licensing and Usage.
2. Click Edit License.

### 2. Provide the License Serial Number

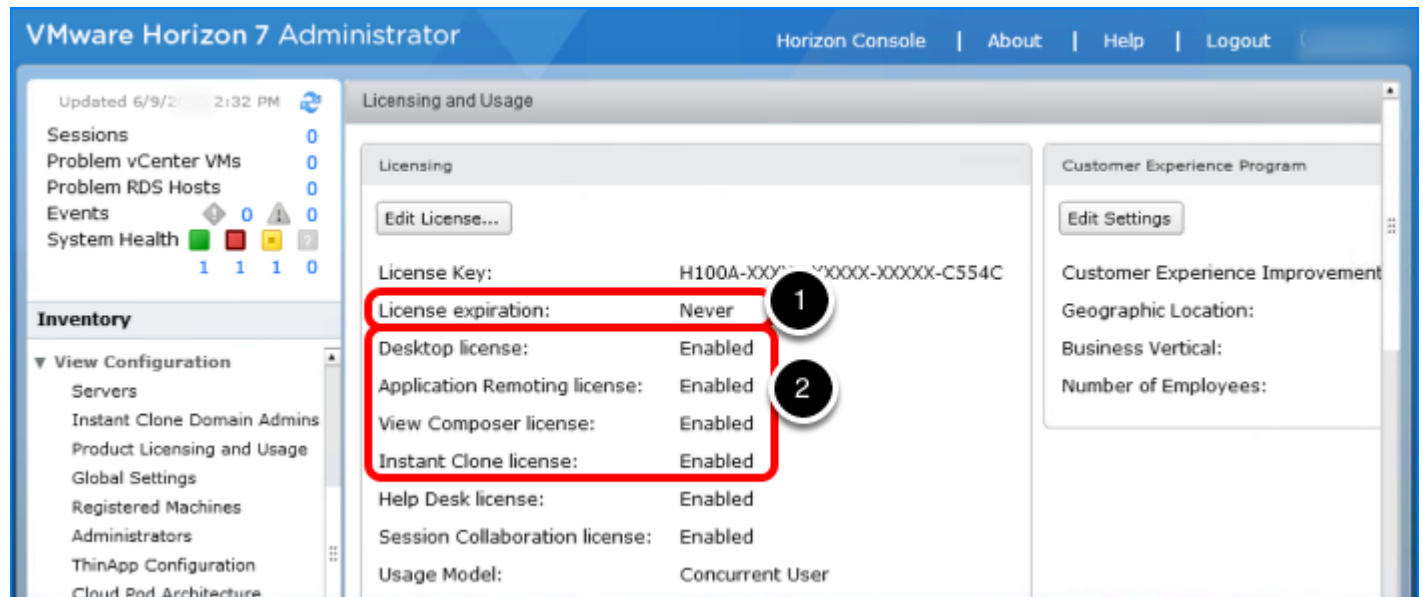

1. Enter the 25-character serial number of the product license key.

2. Click OK.

### 3. Verify Successful License Edit

1. Verify that the license expiration date has not already passed.
2. Verify that the licenses for Desktop, Application Remoting, Composer, and Instant Clone are all enabled.

# Add a vCenter Server Instance

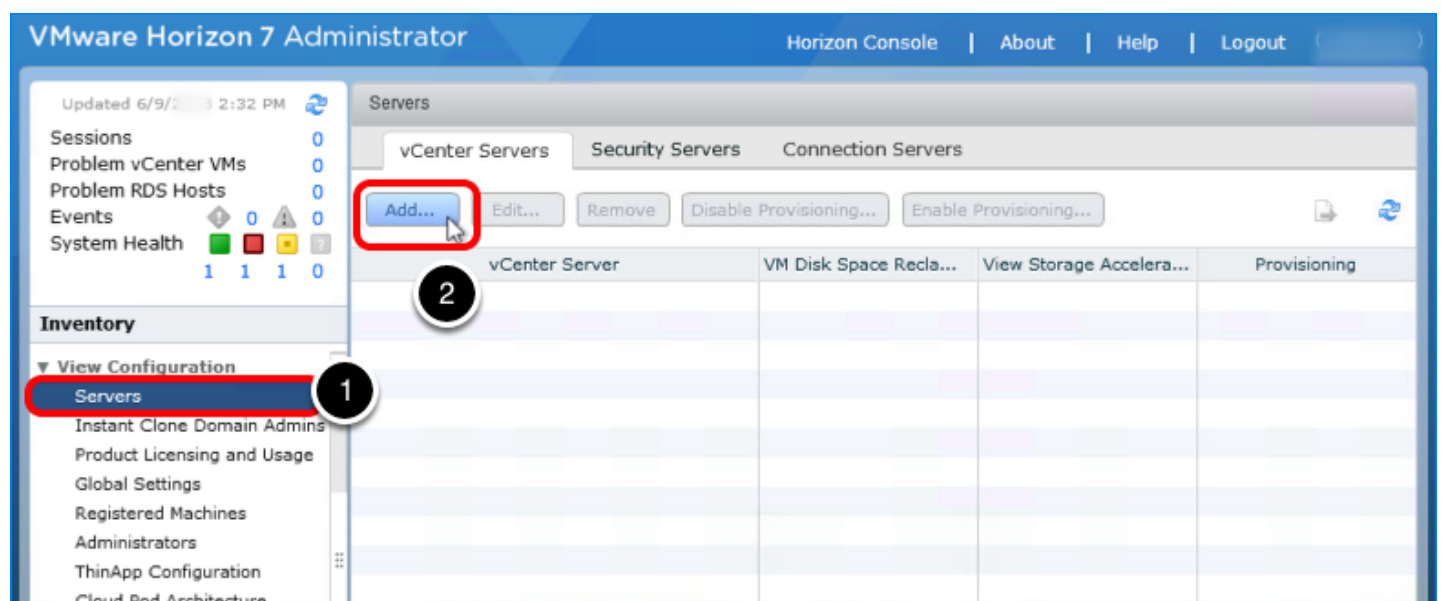

vCenter Server creates and manages the virtual machines used in Horizon 7 desktop pools. The Connection Server uses a secure channel (SSL) to connect to the vCenter Server instance.

## Prerequisites for Adding vCenter Server

Before you perform this exercise you need the following:

- Horizon 7 license – See [Add the Product License Key](#).
- vCenter Server user account – For more information, see [Configure a vCenter Server User for Horizon 7 and View Composer](#). The account privileges you need depend on whether you are using the Composer (which is optional).  
Tip: In a test environment, you could use the administrator account (`administrator@vsphere.local`), which has all administrator privileges.
- View Composer Server user account – (Optional) The account must be a domain user account and must be a member of the local Administrators group on the standalone View Composer machine. Complete this setting if you plan to create linked-clone desktop pools.
- Domain user account for adding linked clones – (Optional) This is a domain administrator account with permissions to create and delete computer objects and write properties in the domain. You already created this user account if you performed the exercise [Create a Domain User Account and OUs in AD for Clone Operations](#). You need this information only if you plan to create linked-clone desktop pools.  
Tip: In a test environment, you could use an account that is a member of the Domain Administrators group, which has all the required privileges.

## 1. Click Add on the vCenter Servers Tab

1. In Horizon Administrator, navigate to View Configuration > Servers.
2. Click Add.

## 2. Enter vCenter Server Settings

The screenshot shows the 'Add vCenter Server' wizard with the 'vCenter Server Information' tab selected. A red box highlights the 'vCenter Server Settings' section, which includes fields for 'Server address', 'User name', and 'Password'. A red circle with the number '1' is next to the 'Server address' field. The 'Server address' field contains 'vc-mgmt.1.com'. The 'User name' field contains 'administrator@vsphere.local'. The 'Password' field is masked with asterisks. The 'Port' field contains '443'. The 'Next >' button is highlighted with a red box and a red circle with the number '2'.

**Add vCenter Server**

**VC Information**

View Composer  
Storage  
Ready to Complete

**vCenter Server Information**

**vCenter Server Settings**

Server address: vc-mgmt.1.com

**View Composer Settings**

View Composer can be installed on the vCenter Server host or a standalone host.

Before you add View Composer to View, install a valid SSL certificate signed by a trusted CA. In a test environment, you can use the default, self-signed certificate that is installed with View Composer, but you must accept the certificate thumbprint.

**Next >** Cancel

1. In the View Composer Settings section, select **Standalone View Composer Server**, and configure the following Composer Settings:
  - **Server Address:** Enter the FQDN of your View Composer VM.
  - **User name:** Enter the user name of your vCenter Server user account; for example, `domain.com\user` or `user@domain.com`. This account is described in [Prerequisites for Adding vCenter Server](#).
  - **Password:** Enter the password of your vCenter Server user account.
  - **Port:** Use the default.
2. Click **Next**.

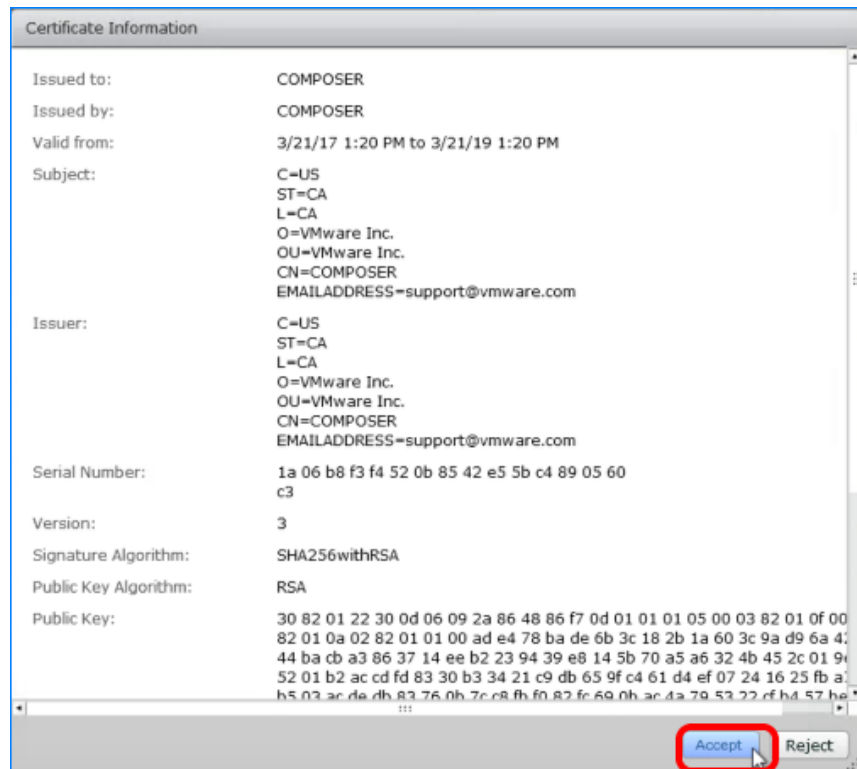

**Important:** If you do not plan to create linked-clone desktop pools, you can skip this step and its sub-steps.

### 3.1. View the Invalid Certificate

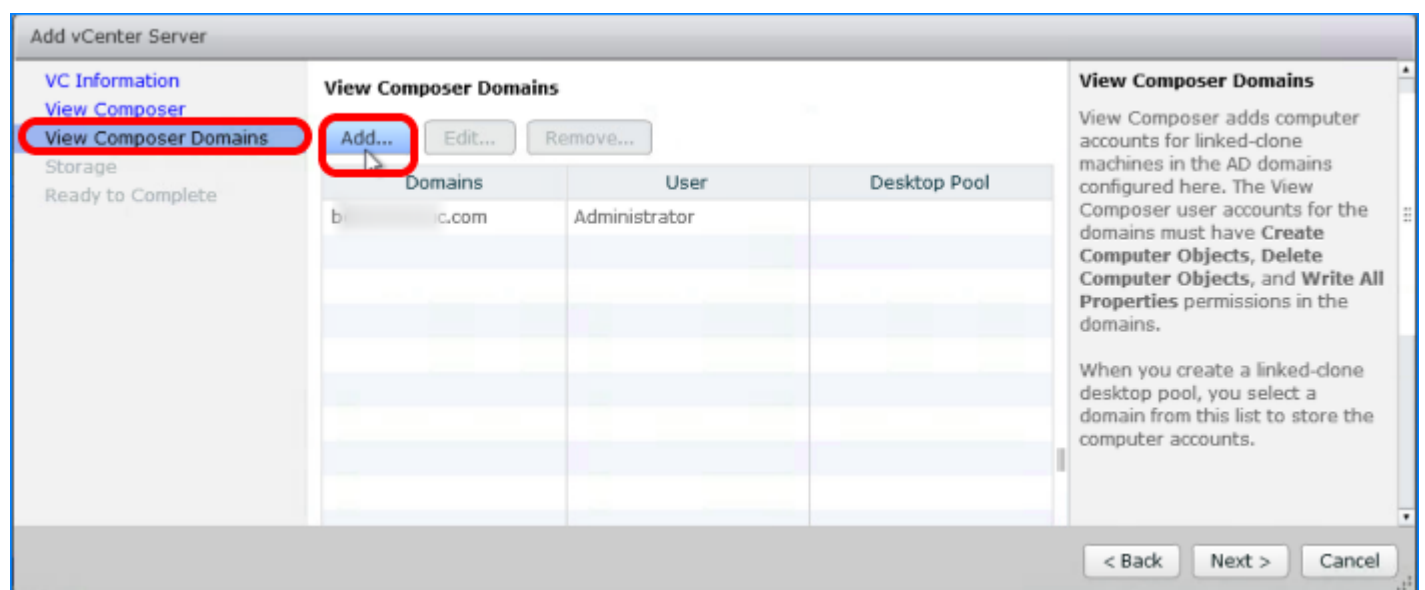

If an Invalid Certificate Detected prompt is displayed, click **View Certificate**.

## 3.2. Accept the Certificate

In the Certificate Information window, review the thumbprint of the default self-signed certificate that was generated during installation, and click **Accept**.

## 3.3. Add the Composer Domain

1. On the View Composer Domains page, click **Add**.

### 3.4. Enter the Domain Data

Add Domain

Full domain name: c.com

User name: Administrator

Password: [masked]

1 OK Cancel

1. In the Add Domain window, enter the domain name, credentials for the domain user account for creating linked clones, as described in [Prerequisites for Adding vCenter Server](#). This account must have permission to create computer objects, delete computer objects, and write properties in the domain or in the OUs (organizational units) that you select when creating desktops in later exercises.
2. Click OK.

### 3.5. Verify the Domain Data

Add vCenter Server

VC Information  
View Composer  
View Composer Domains

View Composer Domains

Add... Edit... Remove...

Domains	User	Desktop Pool
.com	Administrator	

View Composer Domains

View Composer adds computer accounts for linked-clone machines in the AD domains configured here. The View Composer user accounts for the domains must have **Create Computer Objects**, **Delete Computer Objects**, and **Write All Properties** permissions in the domains.

When you create a linked-clone desktop pool, you select a domain from this list to store the computer accounts.

2 < Back Next > Cancel

1. In the View Composer Domains window, verify the information.
2. Click Next.

## 4. Accept Storage Setting Defaults

**Storage Settings**

☒ Reclaim VM disk space

☒ Enable View Storage Accelerator

Default host cache size:  MB

Cache must be between 100 MB and 2048 MB

**Hosts**

☐ Show all hosts

[Edit cache size...](#)

Host	Cache Size
/DC-.../host/Management/w:	Default
/DC-.../host/Management/w:	Default

**Storage Settings**

ESXi hosts can be configured to cache virtual machine disk data, which improves performance during I/O storms such as when many machines power on and run anti-virus scans at once. Hosts read common data blocks from cache instead of reading the OS from disk.

By reducing IOPS during boot storms, View Storage Accelerator lowers the demand on the storage array and uses less storage I/O bandwidth.

**Disk Space Reclamation**

With vSphere 5.x, virtual

< Back **Next >** Cancel

In the Storage Settings section, accept the defaults, and click Next.

## 5. Finish the Process

**Ready to Complete**

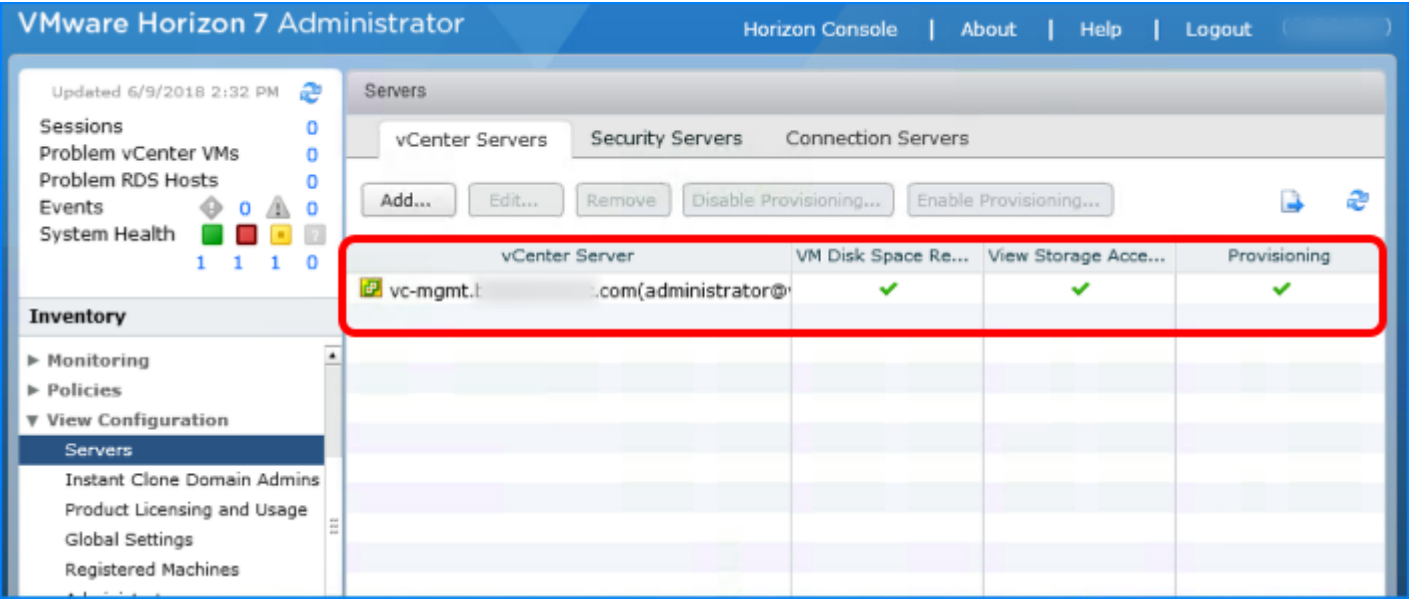

1

vCenter Server	
User name	administrator@vsphere.local
Password	*****
Description	
Server Port	443
Max Provision	20
Max Power	50
Max View Composer Operations	12
Max View Composer Provision	8
Max Instant Clone Engine Provision	20
View Composer State	Standalone View Composer Server
View Composer Address	composer.l...com
View Composer Password	*****
View Composer User Name	administrator@betaumwus.com

2 < Back **Finish** Cancel

1. On the Ready to Complete page, review the vCenter Server information.
2. Click Finish.

## 6. Verify That vCenter Server Is Connected

On the vCenter Servers tab, verify the vCenter Server that you just connected to your Horizon 7 environment.

# Add an Instant-Clone Domain Administrator

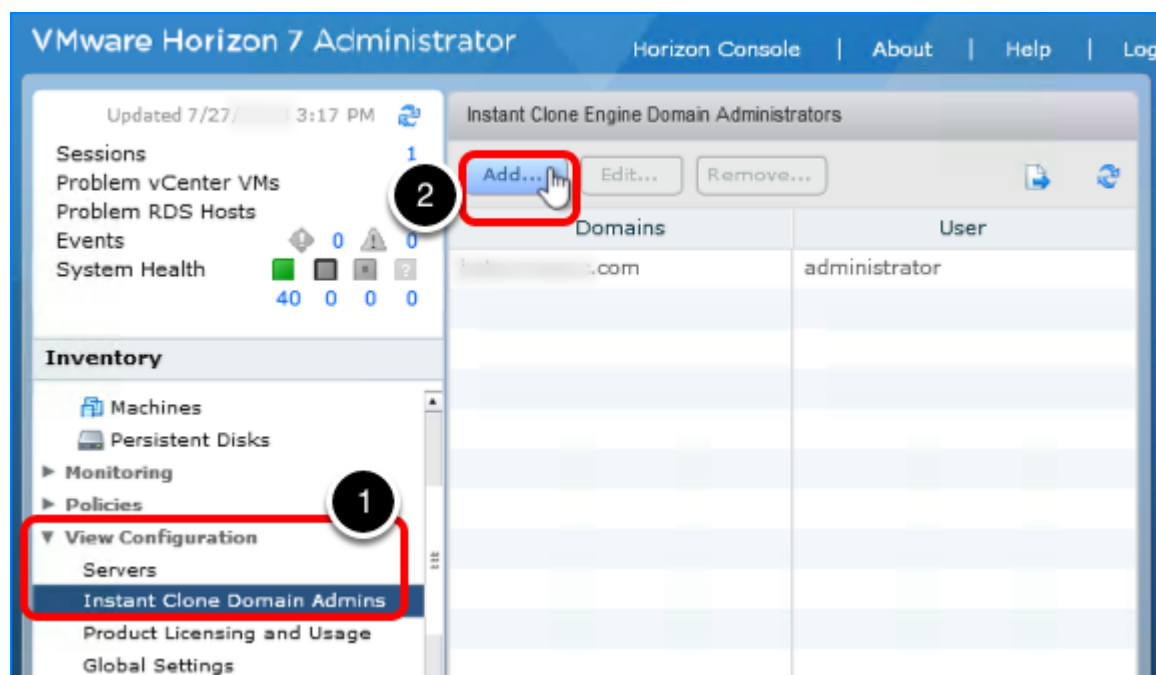

You use Horizon Administrator to specify the user account for joining instant-clone VMs to the Active Directory domain.

## Prerequisites for Adding the Instant-Clone Domain Administrator

Before you perform this exercise, you must have a domain user account that has the required Active Directory permissions so that cloned desktops can be joined to the domain. These include permissions to create and delete computer objects, and write properties in the domain or in the OUs (organizational units) that you select when creating desktops in later exercises. You have already created this user account if you performed the exercise [Create a Domain User Account and OUs in AD for Clone Operations](#).

**Tip:** In a test environment, you could use an account that is a member of the Domain Administrators group, which has all the required privileges.

### 1. Select Instant Clone Domain Admins and Click Add

1. In Horizon Administrator, go to View Configuration > Instant Clone Domain Admins.
2. Click Add.

## 2. Enter Credentials for the Domain Admin User

The screenshot shows a dialog box titled "Add Domain Admin". It contains three main input fields: "Full domain name:" with a dropdown menu showing ".com" (marked with a red box and a circled '1'), "User name:" with the text "Administrator" (marked with a red box and a circled '2'), and "Password:" with masked characters "\*\*\*\*\*" (marked with a red box and a circled '2'). At the bottom, there are "OK" and "Cancel" buttons, with the "OK" button highlighted by a red box and a circled '3'.

1. Select the domain from the drop-down list.
2. Enter the user name and password of the domain user account for creating instant-clones.

# Create an Event Database

In this exercise, you create an event database to log Horizon 7 events to a SQL Server instance, making the event data available to analytics software. For example, you can find the following types of events in the database:

- Alerts that report system failures and errors
- End-user actions, such as logging and starting desktop and application sessions
- Administrator actions, such as adding entitlements and creating desktop and application pools
- Statistical sampling, such as recording the maximum number of users over a 24-hour period

For details about the types of information recorded, see [Integrating Horizon 7 with the Event Database](#). The event database is not required for every Horizon 7 environment. Alternatively, or in addition to using the event database, you can configure Connection Server to send events to a Syslog server or create a flat file of events written in Syslog format. See [Configure Event Logging for Syslog Servers](#).

## Prerequisites for Setting Up the Event Database

To perform this exercise, you need the following:

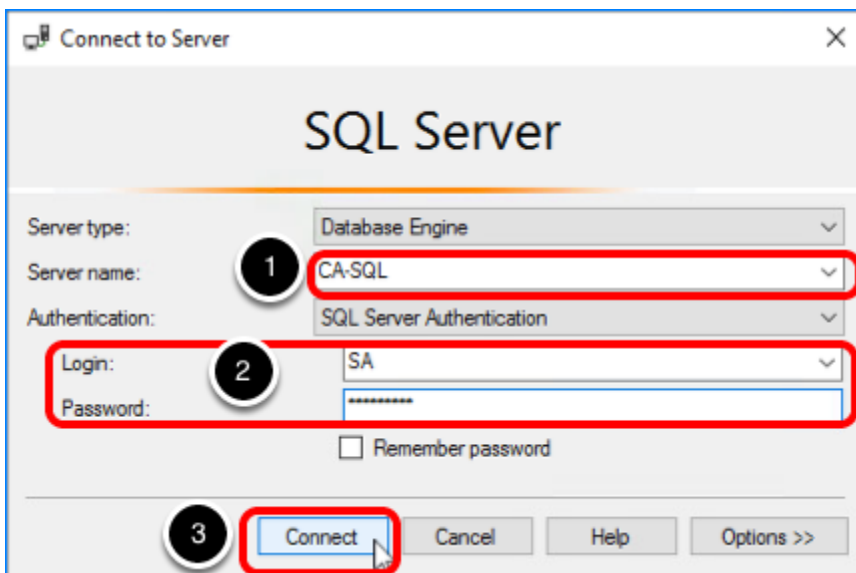

- **SQL Server instance** – This is the database server on which you will create the event database. For the example in this exercise, we used Microsoft SQL Server 2016. To simplify the setup for completing this tutorial in a lab setup, we recommend that you use the same SQL Server instance for the event database, the Composer database, and the JMP server database. For a list of databases that support all three of these components, see [Database Requirements for JMP Server](#).
- **Microsoft SQL Server Management Studio** – For the example in this exercise, we used Microsoft SQL Server Management Studio v17.7. The instructions might differ slightly for different versions of SQL Server Management Studio.
- **Microsoft SQL Server Configuration Manager** – For the example in this exercise, we used SQL Server 2016 Configuration Manager. The instructions might differ slightly for different versions of SQL Server Configuration Manager.
- **SA credentials** – To create the necessary logins for the JMP server database, you will log in to the SQL Server instance as the sysadmin (SA) or as a user account with SA privileges.

## 1. Open Microsoft SQL Server Management Studio

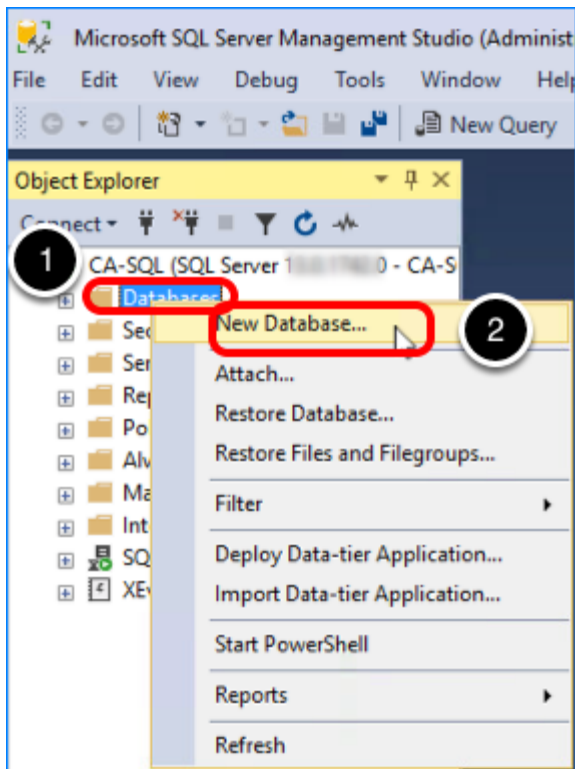

1. On the VM where SQL Server and SQL Server Management Studio are installed, click the Start button.
2. Navigate to and select Microsoft SQL Server Management Studio.

## 2. Connect to the SQL Server Instance

1. Select the SQL Server instance from the drop-down list.
2. Log in as the sysadmin (SA) or using a user account with SA privileges.
3. Click Connect.

### 3. Create a Database for Horizon 7 Events

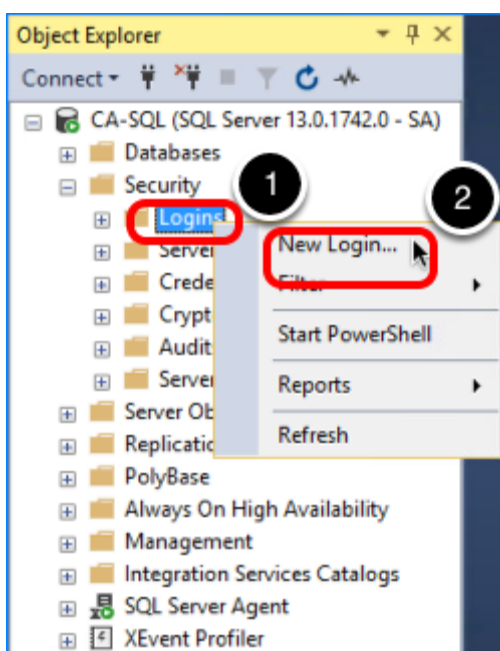

1. In the Object Explorer, right-click Databases.
2. Select New Database.

## 4. Name the Database

1. For the database name, enter `Horizon7Events`. Use the default settings.
2. Click OK.

## 5. Create a Database Login for the Connection Server Machine

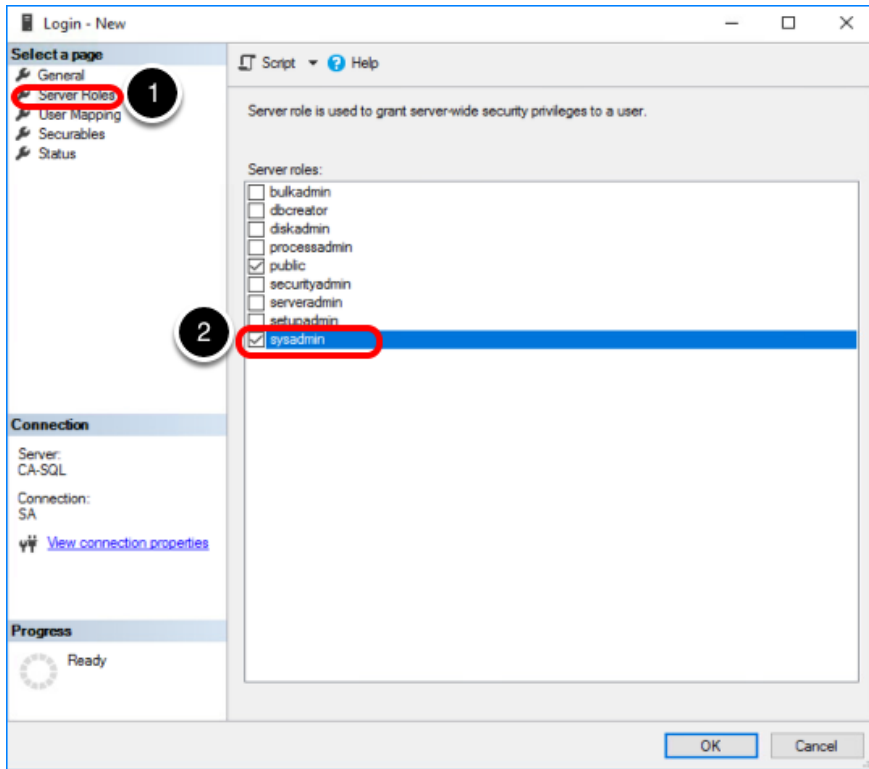

1. To create a login so that the Connection Server can access the database to log events, expand the **Security** folder, and right-click **Logins**.
2. Select **New Login**.

## 5.1. Complete the General Settings

1. Enter a login name to use for the Connection Server machine, using ASCII characters only; for example, `Horizon7EventsUser`.
2. Select **SQL Server authentication**, and create a password.
3. De-select **Enforce password policy**. For the purposes of this exercise, you do not need to use password policies.
4. Either leave **master** as the default database or select the **Horizon7Events** database as the default database.
5. Select a default language.

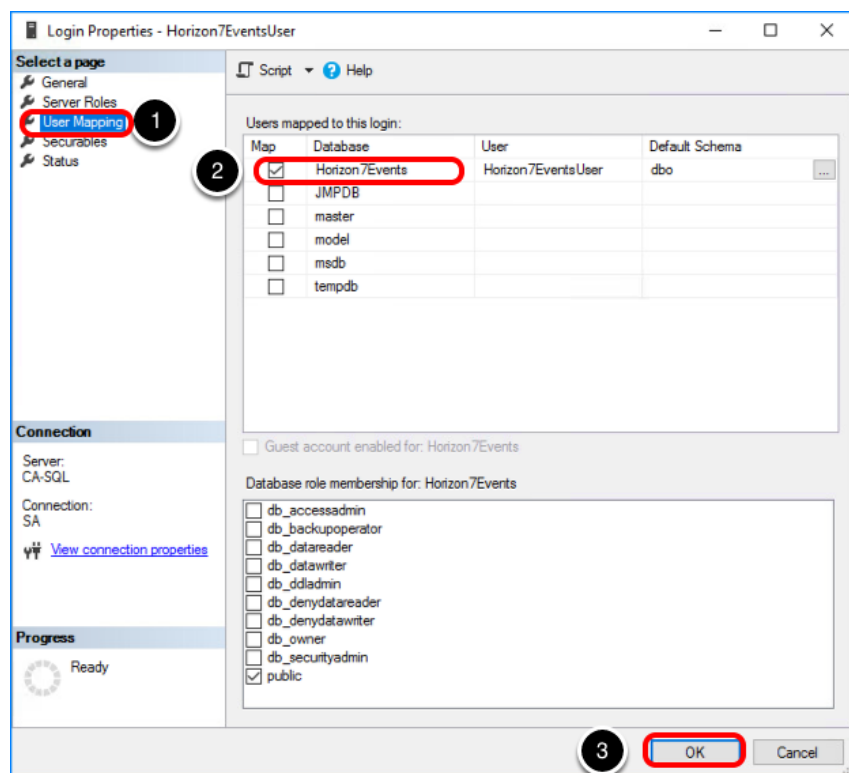

## 5.2. Assign the sysadmin Server Role

1. Select the Server Roles page.
2. Select the sysadmin check box.

## 5.3. Map the Login to the Horizon7Events Database

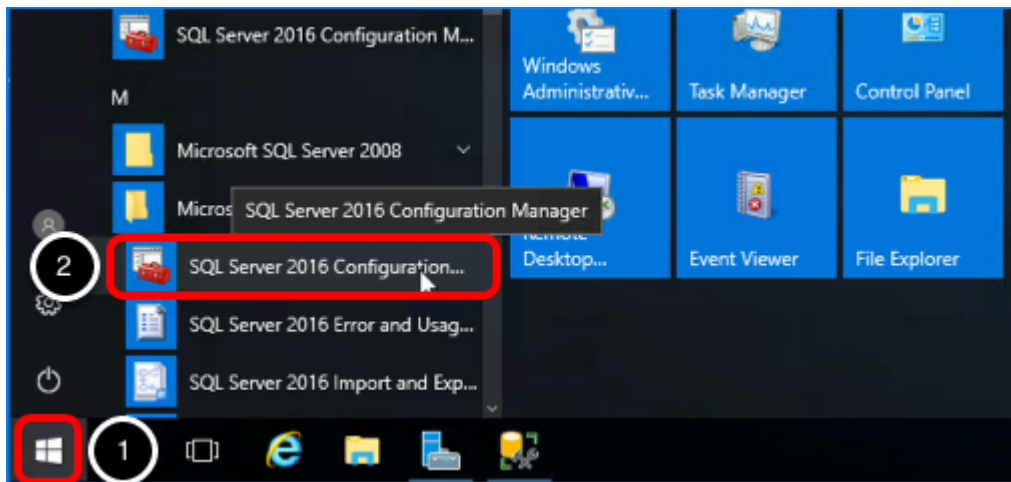

1. Select the User Mapping page.
2. Select the Horizon7Events database.
3. Click OK.

The new login is added under the Logins folder in the Object Explorer pane, and the user is added under the Databases > Horizon7Events > Security > Users folder.

## 6. Configure TCP/IP Properties for the Database Server

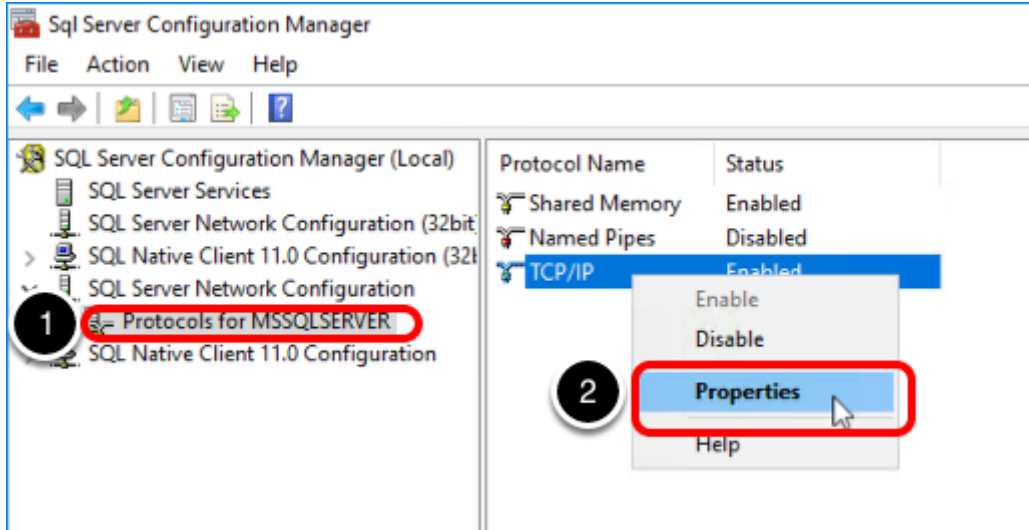

You must verify that the TCP/IP protocol is enabled and that the default port 1433 is used for all IP addresses.

## 6.1. Launch the SQL Server Configuration Manager

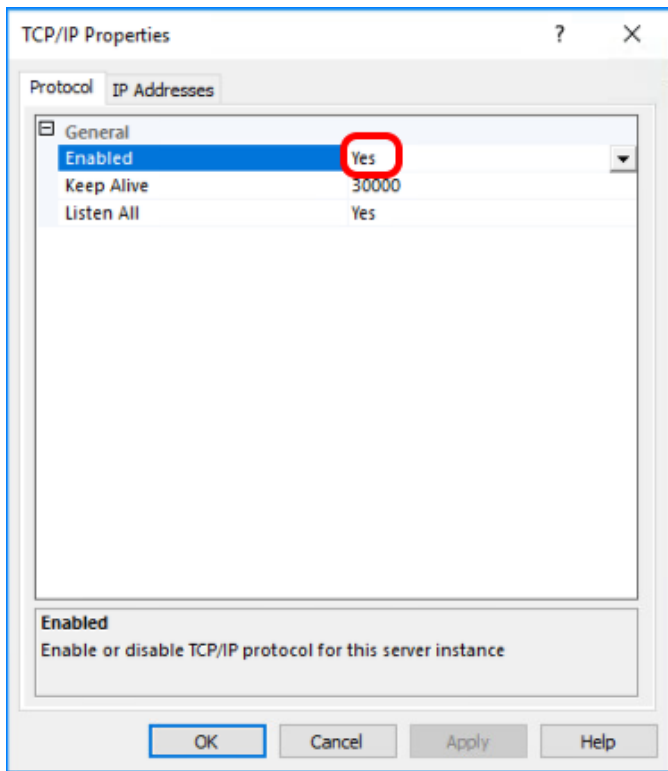

1. On the VM where SQL Server and SQL Server Configuration Manager are installed, click the Start button.
2. Navigate to and select SQL Server Configuration Manager.

## 6.2. Open the TCP/IP Properties Dialog Box

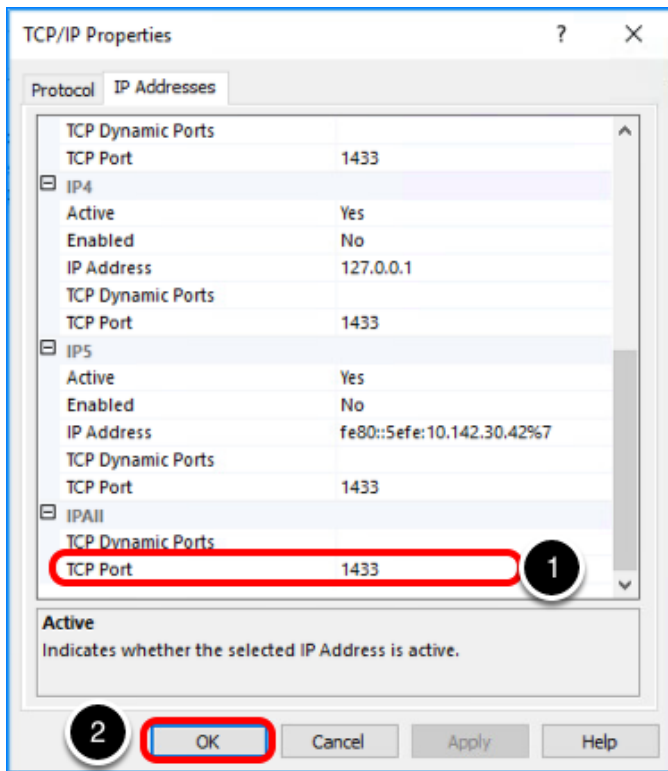

1. Expand SQL Server Network Configuration, and select Protocols for `<server name>`.
2. In the list of protocols, right-click TCP/IP, and select Properties.

## 6.3. Enable the Protocol

On the Protocol tab, set or verify that the Enabled property is set to Yes.

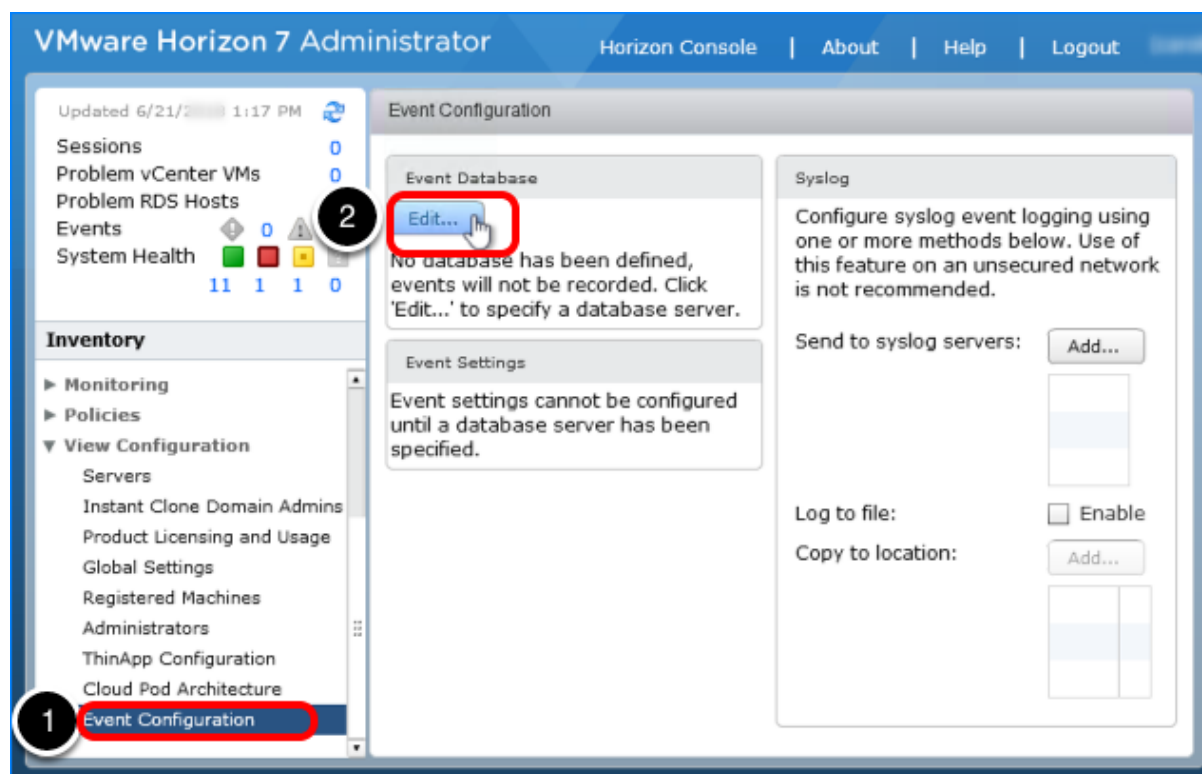

## 6.4. Verify That the Default Port 1433 Is Used

1. On the IP Addresses tab, set or verify that the TCP port for IPAll is set to the default port 1433.
2. Click OK.

The database server is now properly configured.

## 7. Configure the Event Database in Horizon Administrator

1. In Horizon Administrator, navigate to View Configuration > Event Configuration.
2. In the Event Configuration pane, click Edit.

## 8. Complete the Event Database Configuration Dialog Box

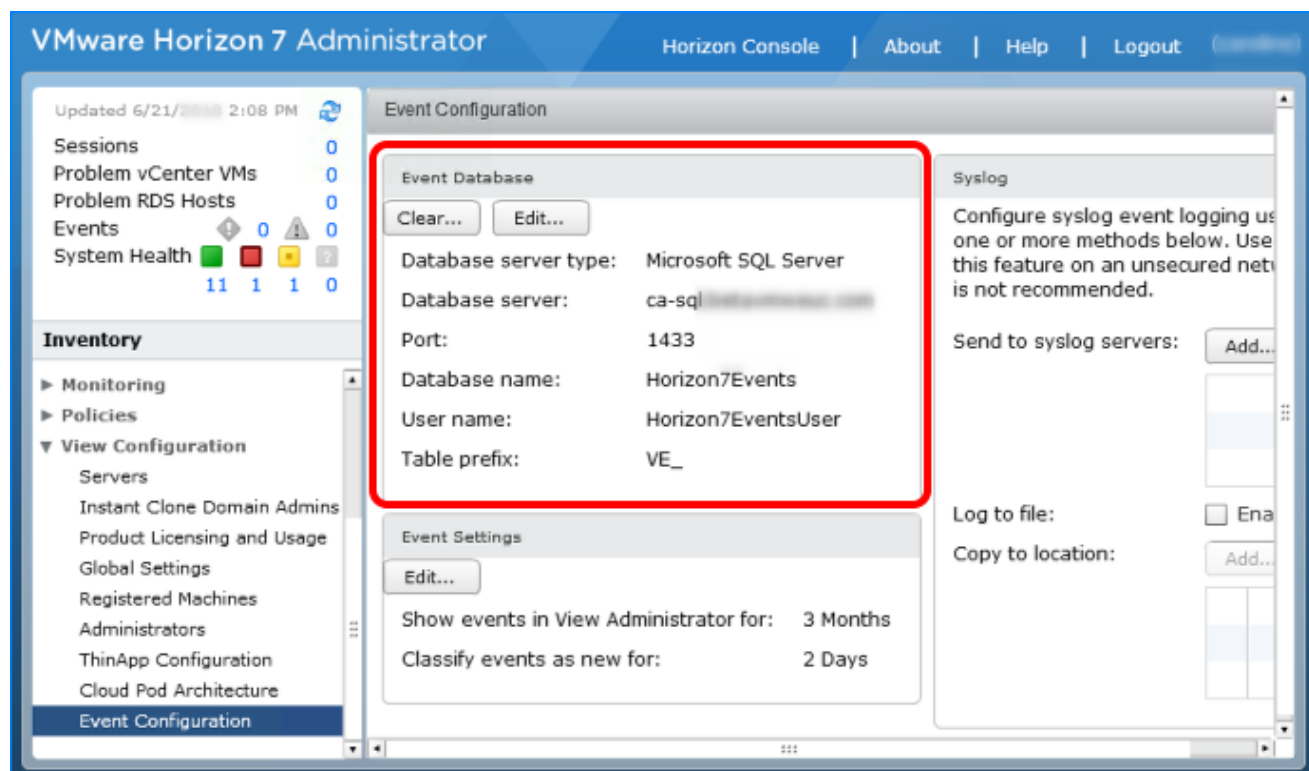

1. In the Edit Event Database window, enter the following information:

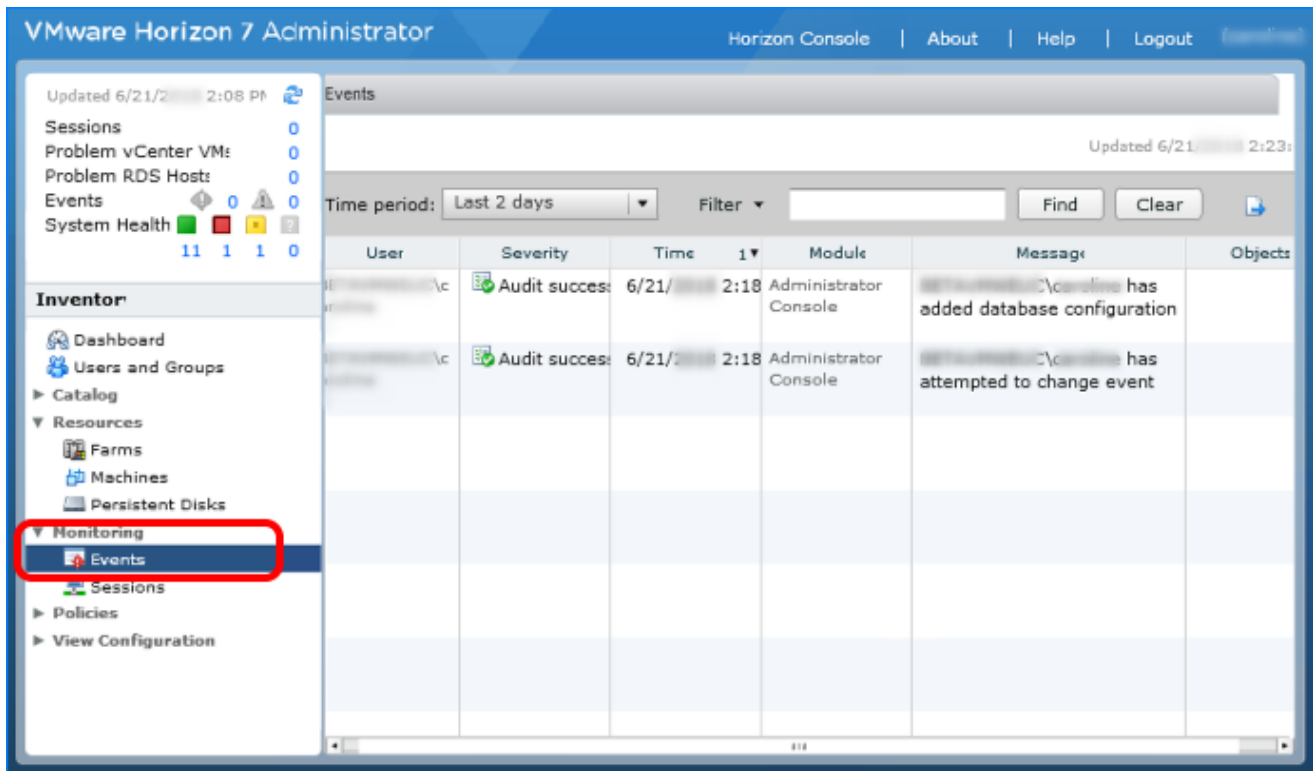

- Database server – Enter the DNS name or IP address.
- Database type – Accept the default Microsoft SQL Server.
- Port – Accept the default port number (1433) used to access the database server.
- Database name – Enter the event database name created on the database server; for example, `Horizon7Events`.
- User name and Password – Enter the credentials for the user you created for this database in [Complete the General Settings](#). For this example, the user name is `Horizon7EventsUser`.
- Table prefix – Enter `VE_` (for View Events).

2. Click OK.

The configuration settings you entered are displayed on the Event Configuration page.

## 9. Verify a Successful Connection

Under **Monitoring** in the navigation bar on the left, select **Events** to verify that the connection to the event database is successful.

# Creating Single-User Desktop Pools

# Introduction

With single-user desktops, each virtual machine allows a single end-user connection at a time. In contrast, with session-based desktops, one RDSH server can accommodate many concurrent user connections. This chapter provides the following exercises for creating various types of pools that contain Windows-based single-user desktops:

- Instant-clone desktop pools
- Full-clone desktop pools
- Linked-clone desktop pools

A shared-session, RDSH desktop pool has different characteristics than a single-user automated desktop pool. Exercises for creating an RDSH desktop pool, which is based on a session to an RDSH server, appear in the next chapter, [Creating RDSH-Published Desktops and Applications](#).

Besides Windows-based desktops, you can create Linux-based desktops, see [Setting Up VMware Horizon 7 for Linux Desktops](#).

# Deploy an Instant-Clone Desktop Pool

A clone is a copy of a master VM with a unique identity of its own, including a MAC address, UUID, and other system information. The VMware [Instant Clone Technology](#) included in Horizon 7 Enterprise Edition and Horizon Apps Advanced Edition improves and accelerates the process of creating cloned VMs over the previous View Composer [linked-clone technology](#). In addition, instant clones require less storage and less expense to manage and update because the desktop is deleted when the user logs out, and a new desktop is created using the latest master image.

Creating an instant-clone desktop pool or RDSH server farm is a two-part process:

- Publishing, also called priming, the master image
- Provisioning the VMs in the pool or farm

Publishing the master image can take from 7 to 40 minutes, depending on the type of storage you are using. Provisioning the VMs takes only 1 or 2 seconds per VM. You can perform these tasks at separate times, so that the provisioning process occurs either at a scheduled time or immediately after the publishing process is complete.

The Add Desktop Pool wizard or the Add Farm wizard in the Horizon Console guides you through the process of publishing the master image. Completing the wizard for instant clones is similar to adding any type of pool or farm.

For this exercise, you will use the newest Horizon 7 management interface, the Horizon Console.

**Important:** If your session in the Horizon Console is idle for more than a few minutes, you might be automatically logged out, and if you were in the middle of creating a desktop pool, your changes are lost.

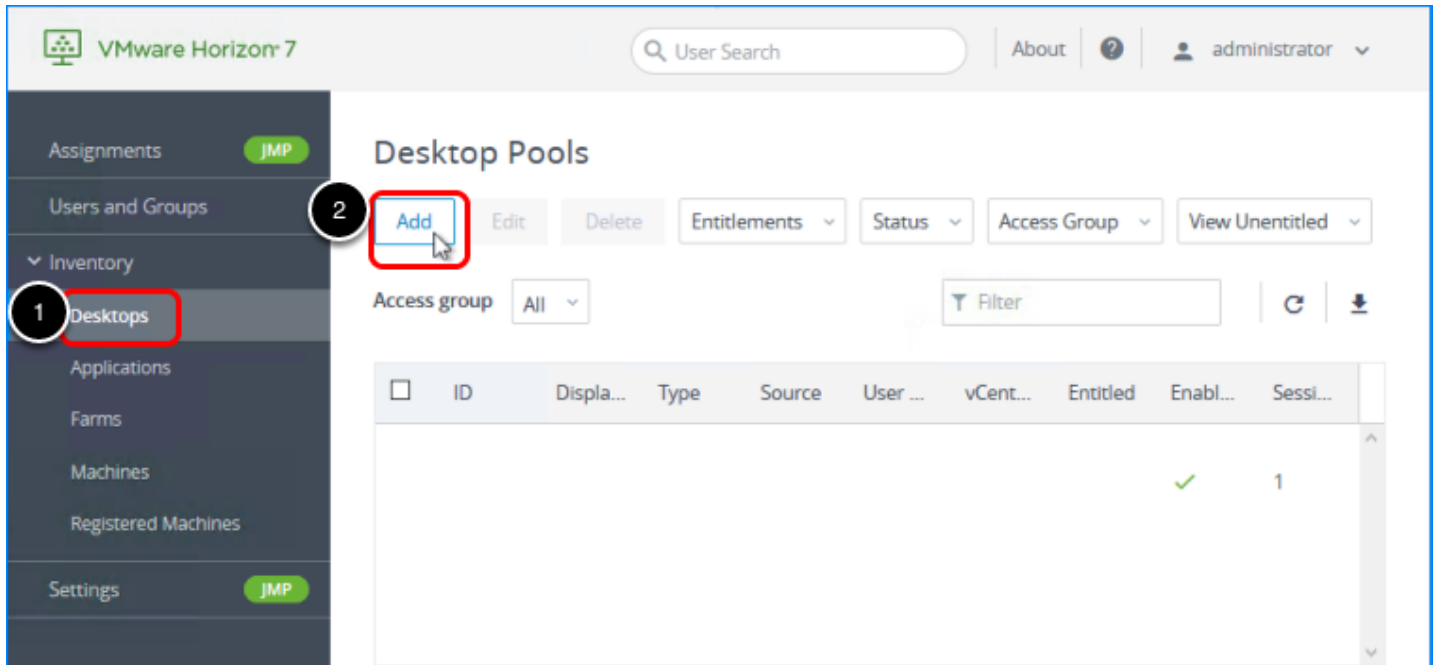

## Prerequisites for Deploying an Instant-Clone Pool

To perform this exercise, you need the following:

- **Master VM and snapshot** – Before you can deploy a pool of desktops, you must create an optimized master image, which includes installing and configuring a Windows operating system in a VM, optimizing the OS, and installing the various VMware agents required for desktop pool deployment. For step-by-step instructions, see the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#).
- **Connection Server** – For installation and setup instructions, see the exercises [Install Horizon Connection Server](#), [Add the Product License Key](#), and [Add a vCenter Server Instance](#).
- **AD OU** – You must have determined which Active Directory OU to use for storing instant-clone computer accounts. In a test environment, you can use the Computers OU. In a production environment, VMware recommends that you create a specific OU and domain user, and delegate the minimum required permissions, as described in the exercise [Create a Domain User Account and OUs in AD for Clone Operations](#).

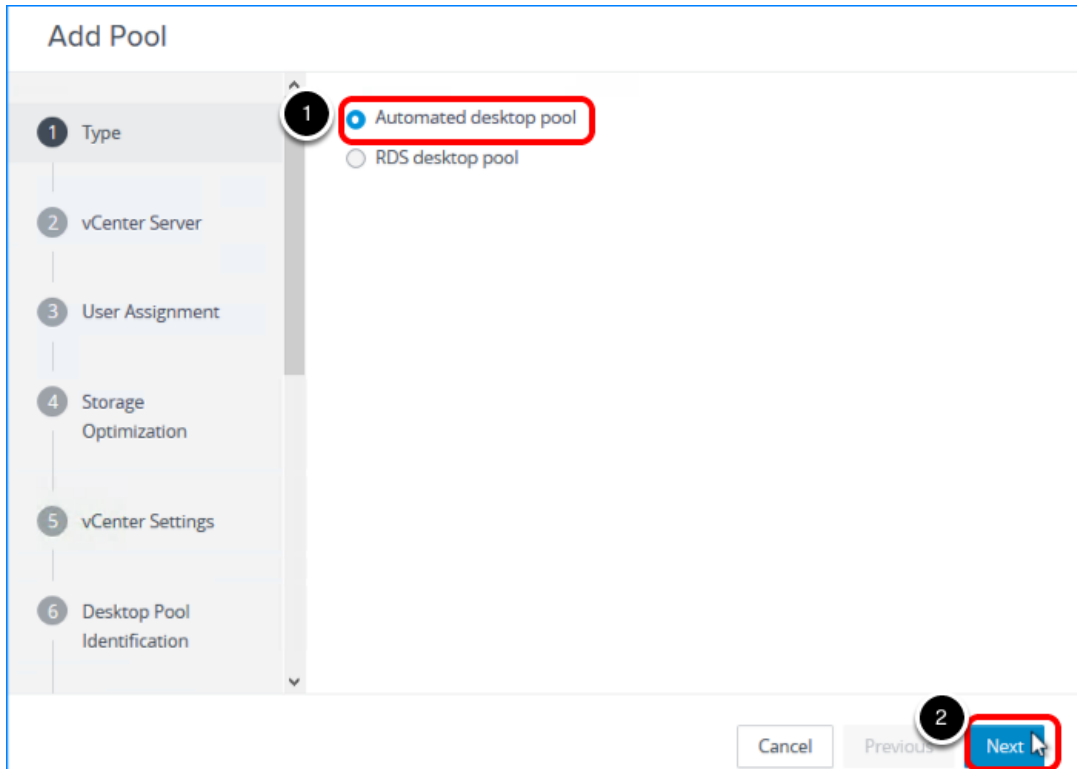

- **Instant-clone domain administrator** – You must have added an instant-clone domain administrator, as described in the exercise [Add an Instant-Clone Domain Administrator](#).
- **VM folder** – (Optional) Having a specific VM folder in the vCenter Server inventory helps you locate and manage the virtual desktops in the instant-clone pool.

## 1. Start the Add Pool Wizard in the Horizon Console

1. Log in to the Horizon Console, and select **Inventory > Desktops**.  
The format of the URL for accessing the console is:  
`https://<connection-server-FQDN>/newadmin`
2. Click **Add**.

## 2. Select the Automated Desktop Pool Type

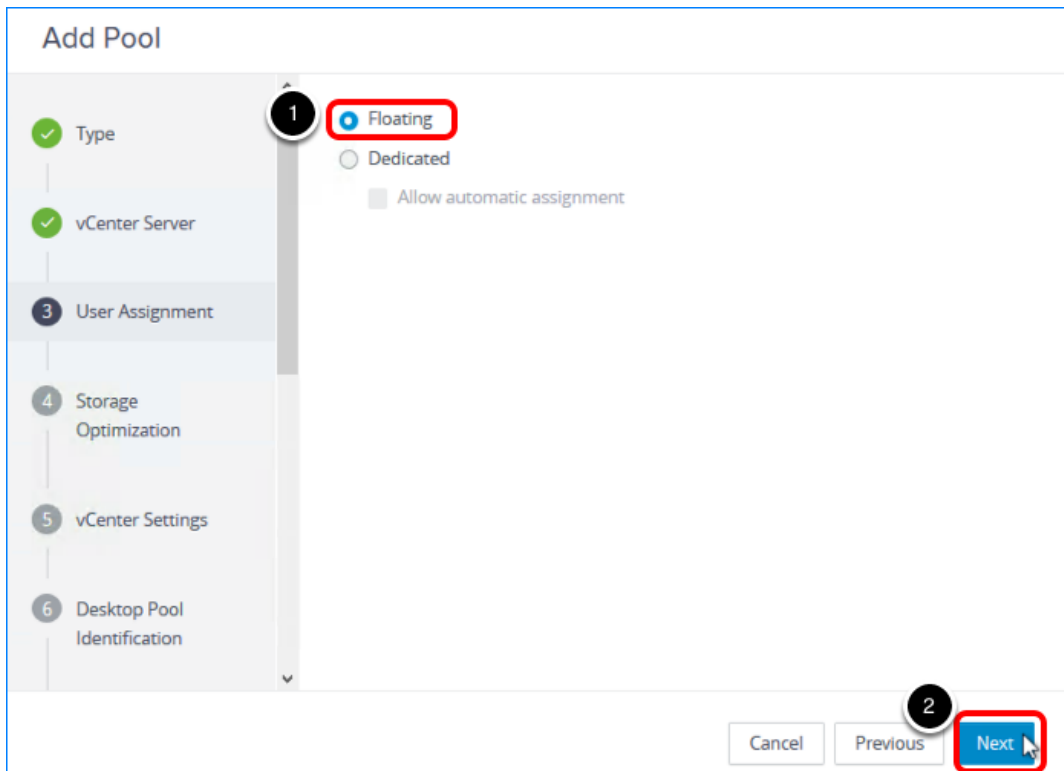

1. Select Automated Desktop Pool.
2. Click Next.

### 3. Select the Instant Clone Type and the vCenter Server Instance

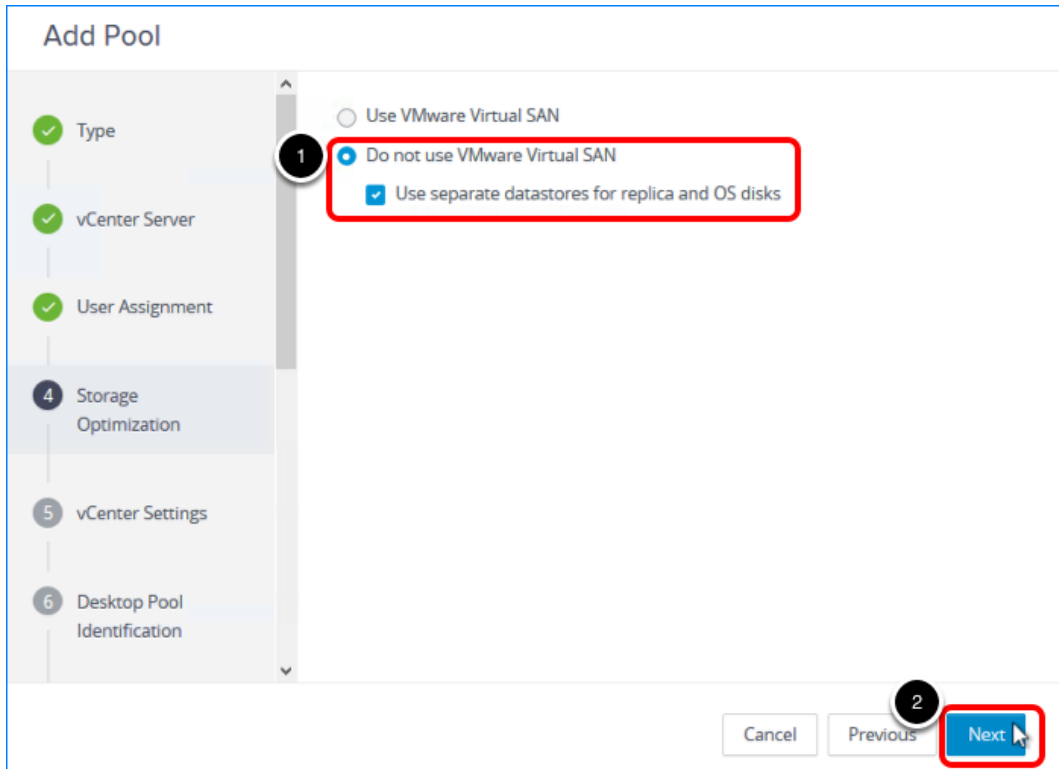

1. Select **Instant Clone**, and, optionally, add a description of the pool.
2. Select the vCenter Server instance.
3. Click **Next**.

## 4. Select Floating Assignment

1. Select **Floating**. Instant-clone pools can use either floating or dedicated user assignment. For this exercise, we use floating assignment.
  - **Dedicated assignment** – Each desktop is assigned to a specific user. A user logging in for the first time gets a desktop that is not assigned to another user. The user always gets this same desktop after logging in, and this desktop is not available to any other user.
  - **Floating assignment** – Users get a random desktop every time they log in. When a user logs out, the desktop is deleted. With automatic deletion, you keep only as many VMs as you need at one time.
2. Click **Next**.

## 5. Choose Whether to Use vSAN

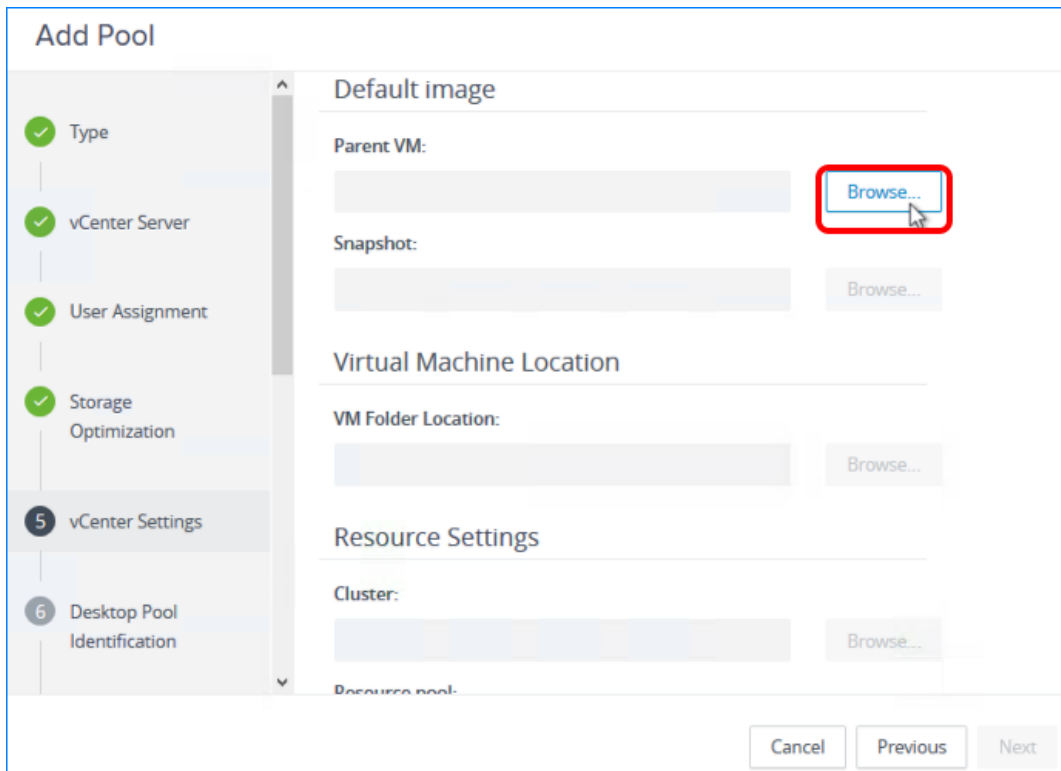

1. Select **Do not use VMware Virtual SAN**, and select **Use separate datastores for replica and OS disks**.
2. Click **Next**.

For this exercise, use separate datastores so that you can see the extra settings in the next window. With separate datastores, you can place the replica VM on a solid-state, disk-backed datastore. Solid-state disks have low storage capacity but high read performance, typically supporting 20,000 IOPS. Separate datastores are used in tiered-storage models.

In a production environment, you might select to use VMware Virtual SAN. VMware Virtual SAN, or [VMware vSAN™](#), is a software-defined storage tier that virtualizes the local physical storage disks available on a cluster of vSphere hosts. You specify only one datastore when creating an automated desktop pool or an automated farm, and the various components, such as virtual machine files, replicas, user data, and operating system files, are placed on the appropriate solid-state drive (SSD) disks or direct-attached hard disks (HDDs).

## 6. Complete the Default Image Settings

The screenshot shows the 'Add Pool' wizard in Horizon Console. On the left, a vertical list of steps includes 'Type', 'vCenter Server', 'User Assignment', 'Storage Optimization', 'vCenter Settings' (highlighted with a '5'), and 'Desktop Pool Identification' (highlighted with a '6'). The main area is titled 'Add Pool' and contains several sections: 'Default image' with 'Parent VM' and 'Snapshot' fields, each with a 'Browse...' button; 'Virtual Machine Location' with a 'VM Folder Location' field and a 'Browse...' button; and 'Resource Settings' with a 'Cluster' field and a 'Browse...' button. The 'Parent VM' 'Browse...' button is circled in red. At the bottom right are 'Cancel', 'Previous', and 'Next' buttons.

Click the **Browse** button next to the first setting, which is **Parent VM**.

**Important:** This page has numerous settings, and in the next steps, we do not copy this screenshot into every step, but instead only refer to it and show a screenshot of the window that appears when you click **Browse** for that setting.

**Note:** This page refers to the *default* image because after the pool is created, you can edit the pool and select a different snapshot to use if you want to push a new image and generate new desktops using that other image.

Describing all the settings in detail is beyond the scope of this quick-start guide. For details about all the settings in the Add Desktop wizard, see the product documentation topic [Worksheet for Creating an Instant-Clone Desktop Pool in Horizon Console](#).

## 6.1. Select a Parent VM

### Select Parent VM

Select the virtual machines to be used as the parent VM for this desktop pool

☐ Show all parent VMs ⓘ

Filter

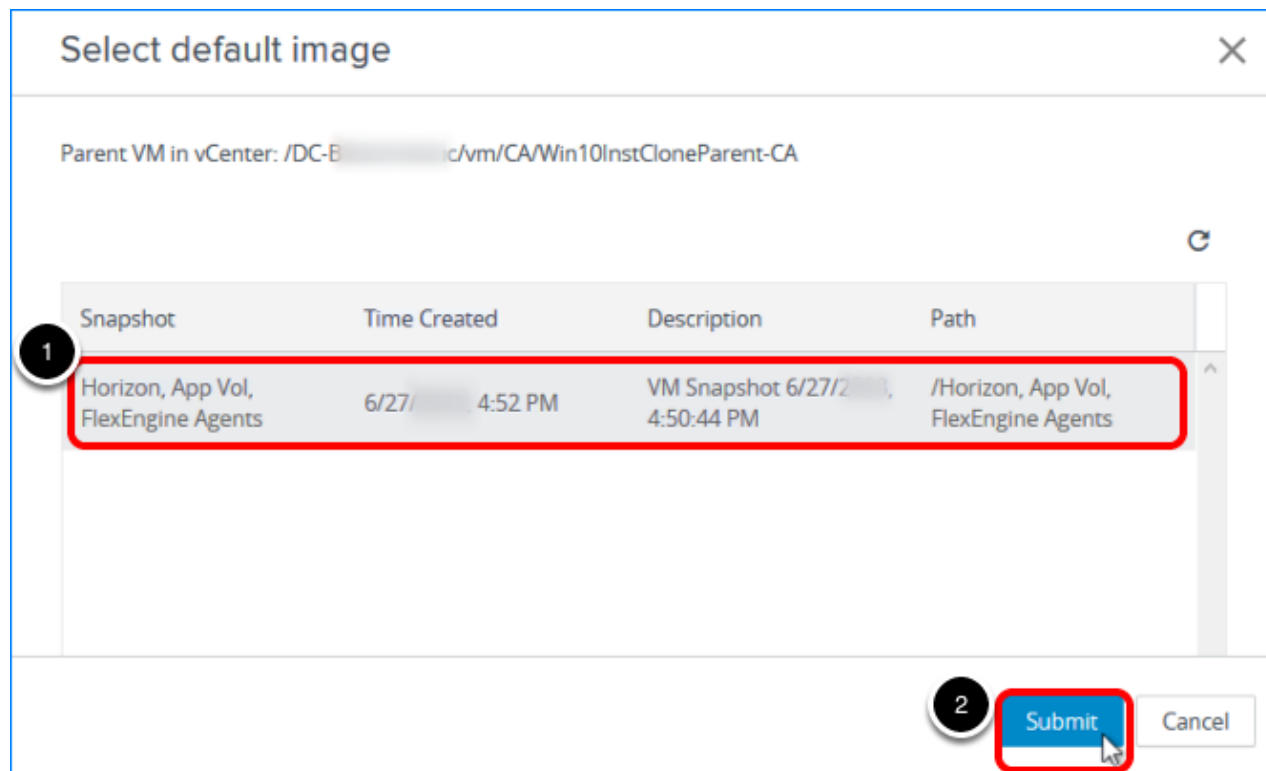

Name	Path
Win10-templ-CA	/DC- /vm/CA/Win10-templ-CA
Win10InstCloneParent-CA	/DC- /vm/CA/Win10InstCloneParent-CA
Ubuntu-1	/DC- /vm/Linux/Ubuntu-1

Submit

Cancel

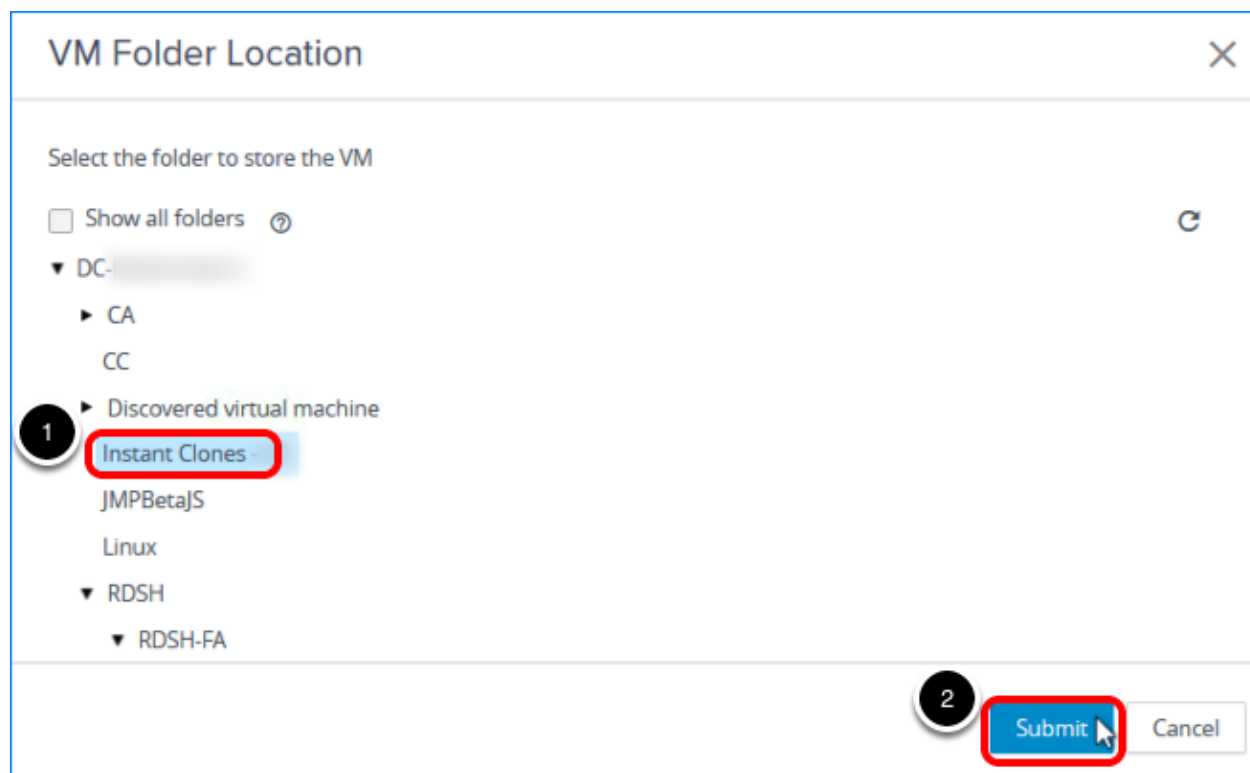

1. Select the master VM that you created.  
For instructions, see the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#).
2. Click **Submit**.

## 6.2. Select a Snapshot of the Master VM

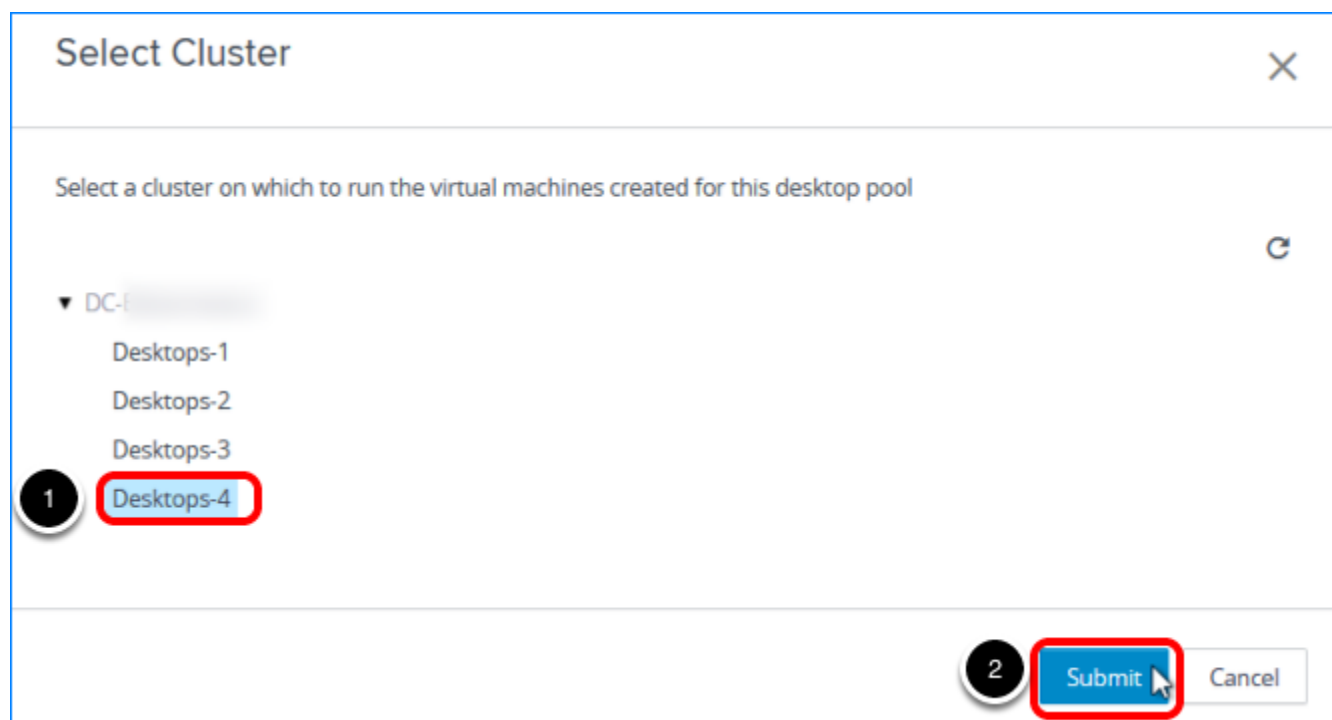

1. Click **Browse** next to **Snapshot**, and select the snapshot to use as the default image for creating the pool.  
For instructions, see the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#).
2. Click **Submit**.

## 6.3. Select a VM Folder for the Instant Clones in the Pool

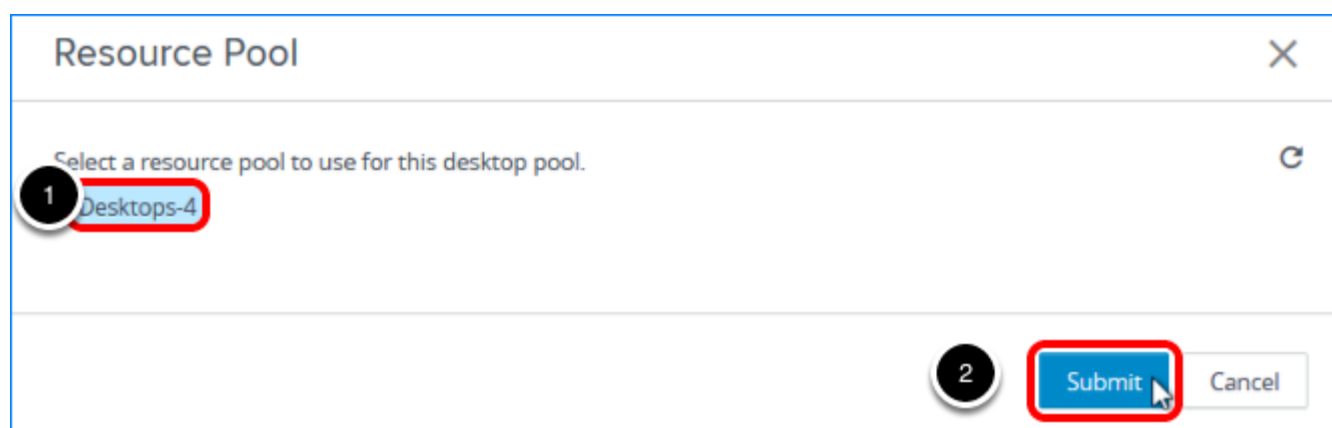

1. Click **Browse** next to **VM Folder Location**, and select the folder to use.  
**Note:** The **Instant Clones** folder shown in the screenshot is just an example; you can select any available folder.  
The VM folder is described in [Prerequisites for Deploying an Instant-Clone Pool](#).
2. Click **Submit**.

## 6.4. Select the Resource Cluster

1. Click **Browse** next to **Cluster**, and select a vCenter Server resource cluster.  
**Note:** The cluster selected in the screenshot is just an example; you can select any available cluster.
2. Click **Submit**.

## 6.5. Select a Resource Pool

1. Click **Browse** next to **Resource Pool**, and select a resource pool.  
**Note:** The resource pool selected in the screenshot is just an example; you can select any available resource pool.
2. Click **Submit**.

## 6.6. Select a Datastore for the Clones

Select Datastores

Select the Datastore type:

Select the instant clone datastores to use for this desktop pool. Only datastores that can be used by the selected host or cluster can be selected.

☐ Show all datastores

<input type="checkbox"/>	Datastore	Capacity(GB)	Free(GB)	FS Type	Drive Type	Storage Ove...
<input type="checkbox"/>	t3600-01-Beta-VDI-4-1	2047.75 GB	1590.60 GB	VMFS6	Non-SSD	Unbounded
<input checked="" type="checkbox"/>	t3600-01-Beta-VDI-4-2	2047.75 GB	1739.44 GB	VMFS6	Non-SSD	Unbounded

2 Submit Cancel

1. Click **Browse** next to **Instant-Clone Datastores**, and select a datastore.  
**Note:** The datastore selected in the screenshot is just an example; you can select any available datastore or multiple datastores.
2. Click **Submit**.

## 6.7. Select a Datastore for the Replica Disk

Select Datastores

Select the Datastore type:

Select the instant clone datastores to use for this desktop pool. Only datastores that can be used by the selected host or cluster can be selected.

☐ Show all datastores

Datastore	Capacity(GB)	Free(GB)	FS Type	Drive Type	Storage Over...
t3600-01-Beta-VDI-4-1	2047.75 GB	1590.60 GB	VMFS6	Non-SSD	Unbounded
t3600-01-Beta-VDI-4-2	2047.75 GB	1739.44 GB	VMFS6	Non-SSD	Unbounded

2 Submit Cancel

1. Click **Browse** next to **Replica Disk Datastores**, and select a datastore.  
**Note:** The datastore selected in the screenshot is just an example; you can select any available datastore or multiple datastores.
2. Click **Submit**.

## 6.8. Select a Network

Select Networks

Select networks to use for this automated pool.

☒ Use network from current parent VM image 1

Select the networks to use for this instant clone pool. Only static binding port groups are supported by instant clones.

Filter

Network	Port Binding	Total Ports	Available Ports
DPG-ESXi_Mgmt	earlyBinding	64	54
DPG-ISCSI1	earlyBinding	64	54
DPG-ISCSI2	earlyBinding	64	54
DPG-vMotion	earlyBinding	64	54

2 Submit Cancel

1. Click **Browse** next to **Network**, and note that by default you use the same network as the master image VM.
2. Click **Submit**.

## 6.9. Click Next on the Default Image Page

The screenshot shows the 'Add Pool' wizard in VMware Horizon. The left sidebar contains a list of steps: Type, vCenter Server, User Assignment, Storage Optimization, vCenter Settings (highlighted with a blue bar and a '5' in a circle), and Desktop Pool Identification (highlighted with a '6' in a circle). The main area is titled 'Resource Settings' and contains several fields with 'Browse...' buttons: 'Cluster' (set to /DC-E.../vm/Instant Clones - CA), 'Resource pool' (set to /DC-E.../host/Desktops-4), 'Instant clone datastores' (1 selected), 'Replica disk datastores' (1 selected), and 'Network' (Parent VM network selected). At the bottom right, there are three buttons: 'Cancel', 'Previous', and 'Next'. The 'Next' button is highlighted with a red rectangular box.

On the page that summarizes the default image settings you selected, click **Next**.

## 7. Enter a Pool ID and Display Name

The screenshot shows the 'Add Pool - Win10-instant-clone' configuration window. On the left, a vertical list of steps includes 'Type', 'vCenter Server', 'User Assignment', 'Storage Optimization', 'vCenter Settings', and 'Desktop Pool Identification' (marked with a '6'). The main configuration area contains the following fields:

- \* ID:** A text box containing 'Win10-instant-clone'.
- Display name:** A text box containing 'Windows 10 Desktop'.
- Access group:** A dropdown menu showing '/'.
- Description:** An empty text area.

At the bottom right, there are three buttons: 'Cancel', 'Previous', and 'Next'. The 'Next' button is highlighted with a red box and a mouse cursor.

1. Add a pool ID.
2. (Optional) Add a display name, which users will see when they log in using Horizon Client or the HTML Access web client.  
If you do not provide a display name, the pool ID is used for the display name.
3. (Optional) Select an access group.  
If you do not specify an access group, the pool is placed in the root access group. For more information about access groups, see the product documentation topic [Manage and Review Access Groups](#).
4. Click **Next**.

## 8. Specify Desktop Pool Settings

The screenshot shows the 'Add Pool - Win10-instant-clone' wizard. On the left, a vertical list of steps is shown: 'User Assignment' (checked), 'Storage Optimization' (checked), 'vCenter Settings' (checked), 'Desktop Pool Identification' (checked), '7 Desktop Pool Settings' (current step, highlighted), and '8 Remote Display Settings'. The main area contains the following settings:

- State:** A dropdown menu set to 'Enabled'.
- Connection Server restrictions:** A dropdown menu set to 'None' with a 'Browse...' button next to it.
- Category Folder:** A dropdown menu set to 'None' with a 'Browse...' button next to it.
- Automatically logoff after disconnect:** A dropdown menu set to 'Never'.
- Allow users to restart/reset machines:** A dropdown menu set to 'No'.
- Allow users to initiate separate sessions from different client devices:** A dropdown menu set to 'No'.

At the bottom right, there are three buttons: 'Cancel', 'Previous', and 'Next'. The 'Next' button is highlighted with a red rectangle and a mouse cursor is clicking it.

For the purposes of this exercise, use the default settings, and click Next.

## 9. Specify Remote Display Settings

The screenshot shows the 'Add Pool - Win10-instant-clone' wizard. The left sidebar lists the steps: Storage Optimization, vCenter Settings, Desktop Pool Identification, Desktop Pool Settings, Remote Display Settings (highlighted with a circled 8), and Provisioning Settings (highlighted with a circled 9). The main area displays settings for Remote Display Settings. The 'Default display protocol' is set to 'VMware Blast'. 'Allow users to choose protocol' is set to 'Yes'. The '3D Renderer' is set to 'Manage using vSphere Client'. Two settings are highlighted with red boxes and numbered: 'HTML Access' is checked and set to 'Enabled' (labeled with a circled 1), and 'Allow Session Collaboration' is checked and set to 'Enabled' (labeled with a circled 2). Both have help icons. At the bottom right, there are 'Cancel', 'Previous', and 'Next' buttons. The 'Next' button is highlighted with a red box and a circled 3.

Example: p1 p2 p3

Use the defaults for the rest of the settings on this page, and click **Next**.

**Note:** For this exercise, you do not enter scripts. In a production environment, you can specify that a script run immediately after a clone is created. You can also run another script before the clone is powered off. These scripts can invoke any process that can be created with the Windows Create Process API, such as `cmd`, `vbscript`, `exe`, and batch-file processes.

## 14. Begin Deploying the Desktop Pool

**Add Pool - Win10-instant-clone**

11 Ready to Complete

☐ Entitle users after this wizard finishes

Type: Automated desktop pool

User Assignment: Floating assignment

vCenter Server: vc-desktops. com

Unique ID: Win10-instant-clone

Description:

Display name: Windows 10 Desktop

Access group: /

State: Enabled

Automatically logoff after disconnect: Never

Connection Server restrictions: None

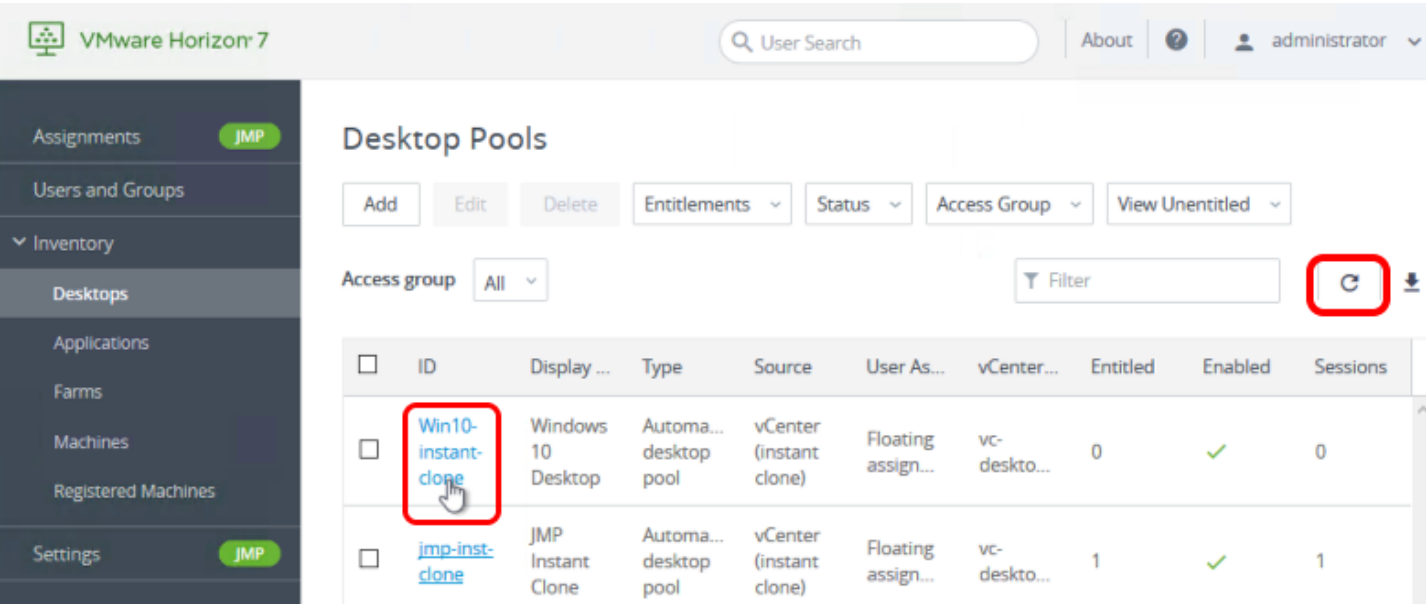

Category Folder: None

Cancel Previous **Submit**

Leave the check box at the top of the window de-selected, and click **Submit**. Entitling users is a separate exercise.

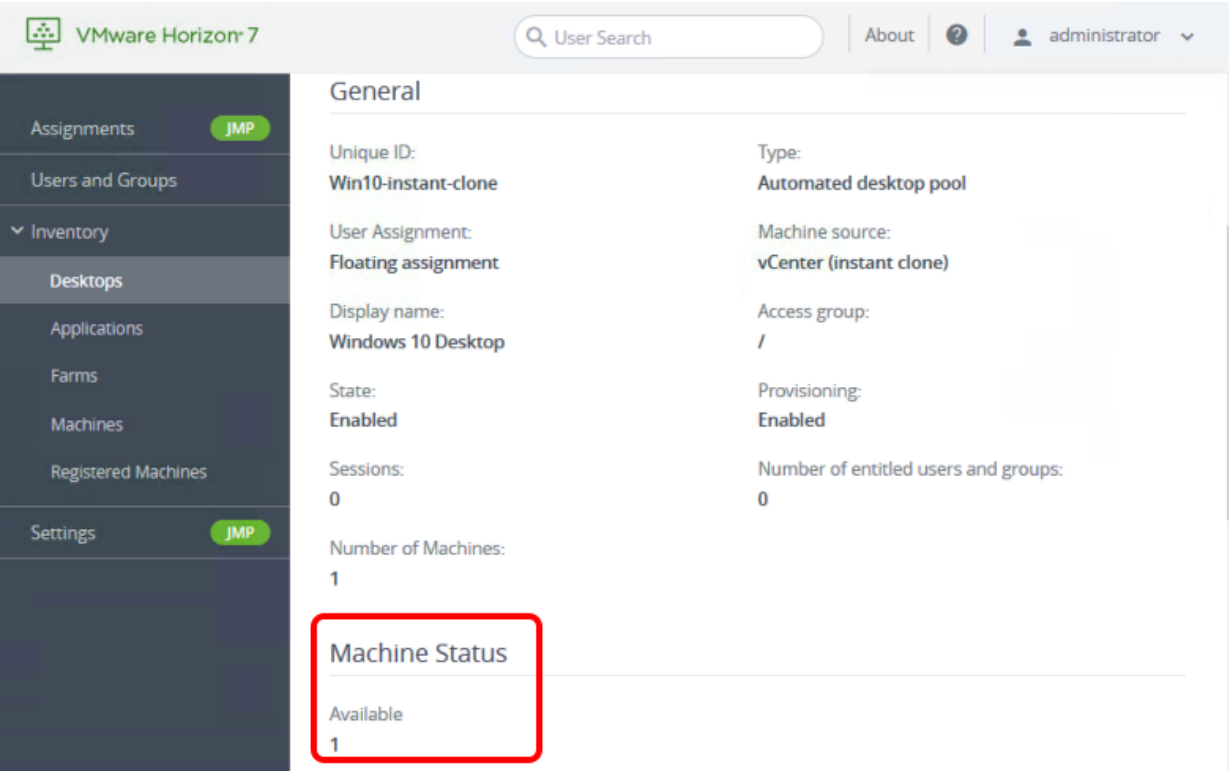

For more information about the available settings in this wizard, see the product documentation topic [Worksheet for Creating an Instant-Clone Desktop Pool in Horizon Console](#).

# 15. Monitor the Pool Creation Process

To access details about the newly added pool, click the pool name on the Desktop Pools page. If you do not see the pool listed, click the Refresh icon above the table.

# 16. Verify That One Instant-Clone Desktop Is Available

In the Machine Status area, verify that one instant-clone desktop is now available. For this exercise, you selected to provision the desktops on demand, with a minimum of one desktop available.

**Important:** Now that you have created an instant-clone desktop pool, you can entitle users to it, either by using the Add Entitlements wizard, as described in a later exercise, or by using the JMP Integrated Workflow to define a JMP assignment. JMP assignments include information about the App Volumes AppStacks, instant-clone desktops pools, and User Environment Manager settings for specific groups of users. For instructions, see the [Quick-Start Tutorial for VMware Horizon JMP Integrated Workflow](#).

# Push a New Image to an Instant-Clone Desktop Pool

To manage OS patches and software updates with instant clones, you use the push-image operation. The push-image operation achieves the same goal as the recompose operation for View Composer linked clones. However, the recompose operation is slower and requires you to plan for maintenance windows to perform the operation at off-peak hours. Because the provisioning of instant clones is faster than that of View Composer linked clones, it is not necessary to plan for maintenance windows.

Unlike linked clones, instant clones do not need to be recomposed, refreshed, or rebalanced. When a user logs out of the desktop, the desktop is deleted and recreated. This approach to desktop deletion and recreation staggers the patching operation across desktops, eliminates boot storms, reduces storage IOPS, and creates less of a load on the vCenter Server.

For this exercise, you will use the newest Horizon 7 management interface, the Horizon Console.

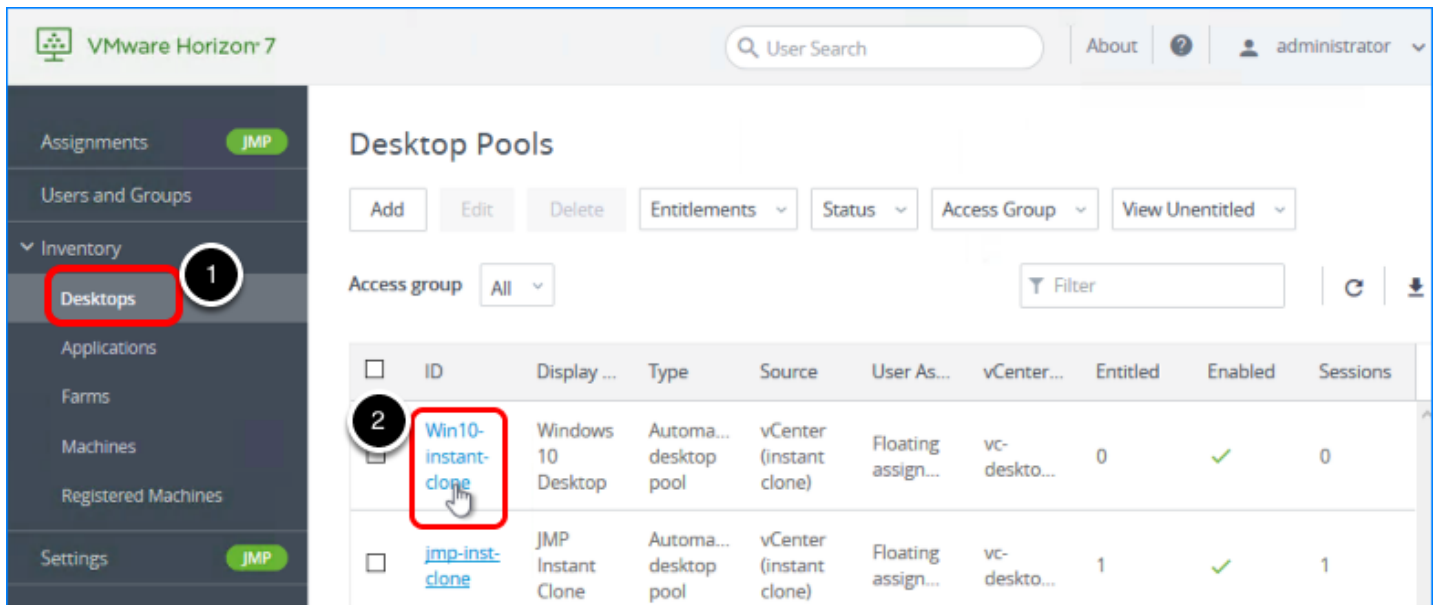

**Important:** If your session in the Horizon Console is idle for more than a few minutes, you might be automatically logged out, and if you were in the middle of creating a push-image operation, your changes are lost.

## Prerequisites for Pushing a New Image

To perform this exercise, you need:

- **Instant-clone desktop pool** – You must have completed the exercise [Deploy an Instant-Clone Desktop Pool](#).
- **New VM snapshot** – You must have a new image to push to the desktop pool. Therefore, use vSphere Web Client, select the VM that you created for deploying the instant-clone pool, and create a new VM snapshot. For details, see the vSphere documentation topic [Taking a Snapshot](#).

## 1. Go to the Summary Page for the Pool

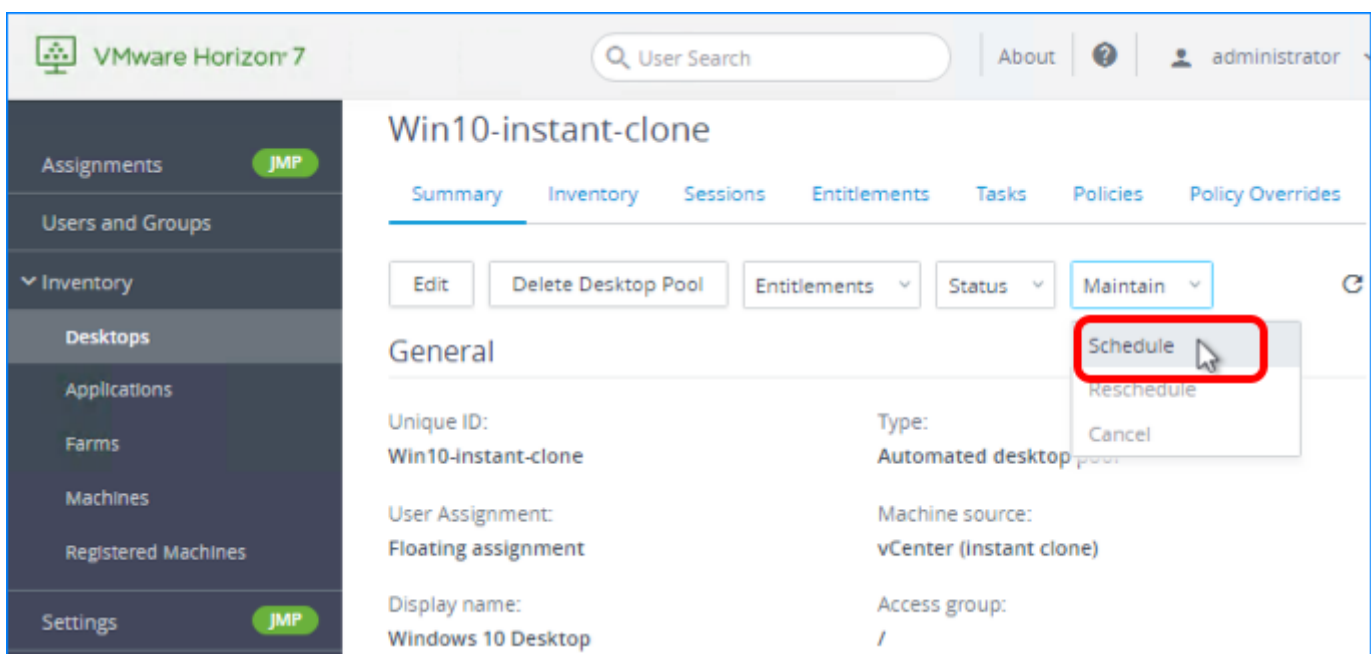

1. Log in to the Horizon Console, and select **Inventory > Desktops**.

The format of the URL for accessing the console is:

<https://<connection-server-FQDN>/newadmin>

2. Click the pool name on the Desktop Pools page.

## 2. Select to Schedule Maintenance

On the **Summary** tab, select **Schedule** from the **Maintain** drop-down list.

### 3. Select a New VM Snapshot

**Schedule Push Image**

**1 Image**

Select the snapshot that will be used as the image. This snapshot can be on the current parent VM or a different one.

The machines created in this desktop pool will use the information in the image as their baseline system configuration.

**Parent VM in vCenter:**

/DC: /Win10InstCloneParent:

**Snapshot:**

Snapshot	Time Created	Description	Path
Horizon, App Vol, FlexEngine Agents	6/27/2024 4:52 PM	VM Snapshot 6/27/2024 4:50:44 PM	/Horizon, App Vol, FlexEngine Agents
OS Updates for this week	8/16/2024 2:34 PM		/Horizon, App Vol, FlexEngine Agents/OS Updates for this week

**2**

1. Select the new snapshot that you created.
2. Click **Next**.

For this exercise, we select a new snapshot taken of the same master VM, but you can also use this page to navigate to a different VM and select a snapshot.

## 4. Click Next to Start the Task After Users Log Off

The screenshot shows the 'Schedule Push Image' wizard in three steps: 1. Image (completed), 2. Schedule (current), and 3. Ready to Complete. The 'Scheduling' section is active, showing options for when the task starts. The 'Start at' field is set to 08-16 at 14:35 Web browser local time. The 'Wait for users to log off' option is selected, with a description: 'Wait for connected users to disconnect before the task starts. The task starts immediately on machines without active sessions.' The 'Force users to log off' option is unselected, with a description: 'Users will be forced to log off when the system is ready to operate on their virtual machines. Before being forcibly logged off, users may have a grace period in which to save their work (Global Settings).' The 'Stop at first error' checkbox is checked. Below this, it says 'The warning and grace period can be edited in global settings:'. The 'Display warning before forced logoff' checkbox is checked. The 'Log off time' is set to 5 minutes. The 'Log off message' is displayed in a text box: 'Your desktop is scheduled for an important update and will shut down in 5 minutes. Please save any unsaved'. At the bottom, there are 'Back', 'Next', and 'Cancel' buttons. The 'Next' button is highlighted with a red box.

Leave the start time set to the default so that the push starts after you complete the wizard, and click **Next**.

The default is **Wait for users to log off**. If, instead, you select to force users to log off, you can give users a warning and a grace period of 5 minutes, by default. To edit this setting, after you finish creating the schedule, open the Horizon Administrator (<https://<connection-server-FQDN>/admin>), navigate to **View Configuration > Global Settings**, and click **Edit** in the General settings section.

**Note:** The **Stop at first error** check box is available only if the **Stop provisioning on error** check box is not selected on the **Edit Pool > Provisioning Settings** tab.

## 5. Click Finish to Complete the Maintenance Schedule

**Schedule Push Image**

Ready to Complete

Review the options and click Finish

Forced logoff global settings:

Log off message: Your desktop is scheduled for an important update and will shut down in 5 minutes. Please save any unsaved work now

Log off time: 5 minutes

Affected virtual machines: 3

Start time: 8/16/2024, 2:35 PM

User log off: Wait for users to log off

Stop at first error: Yes

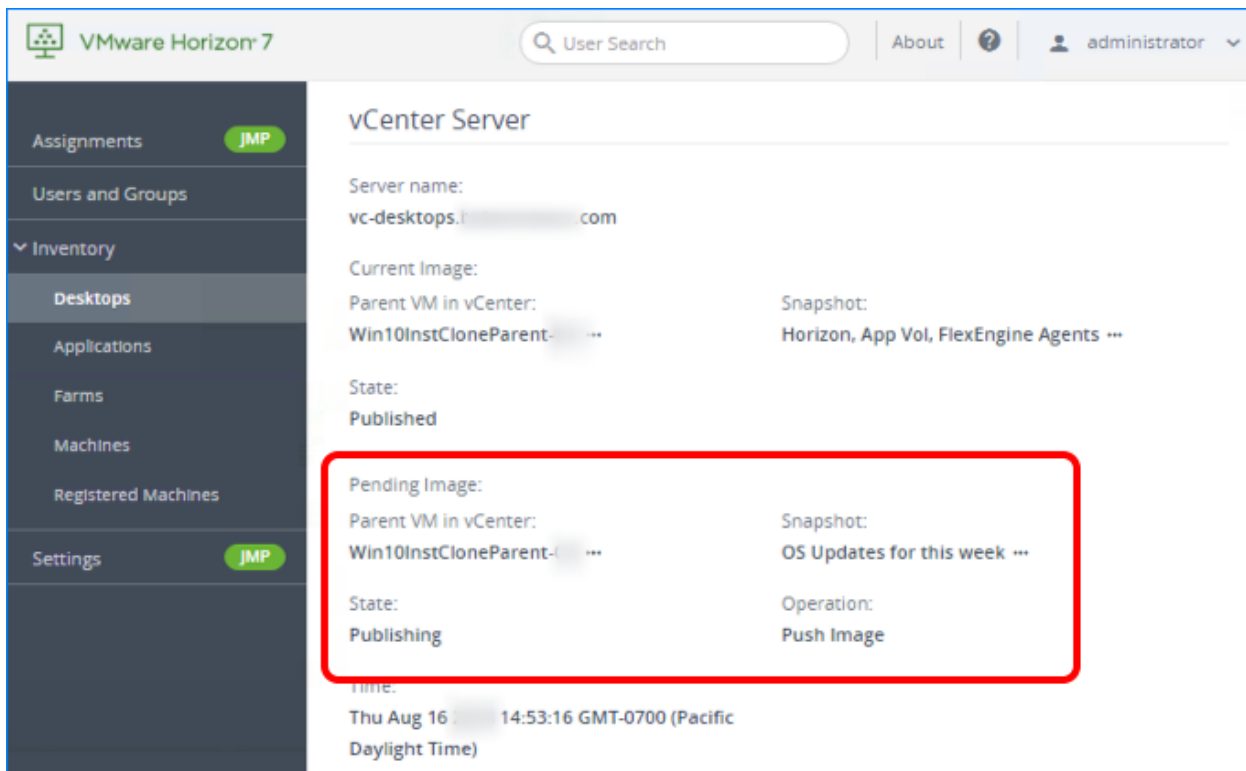

Parent VM in vCenter: /DC-.../Win10InstCloneParent

Image: /Horizon, App Vol, FlexEngine Agents/OS Updates for this week

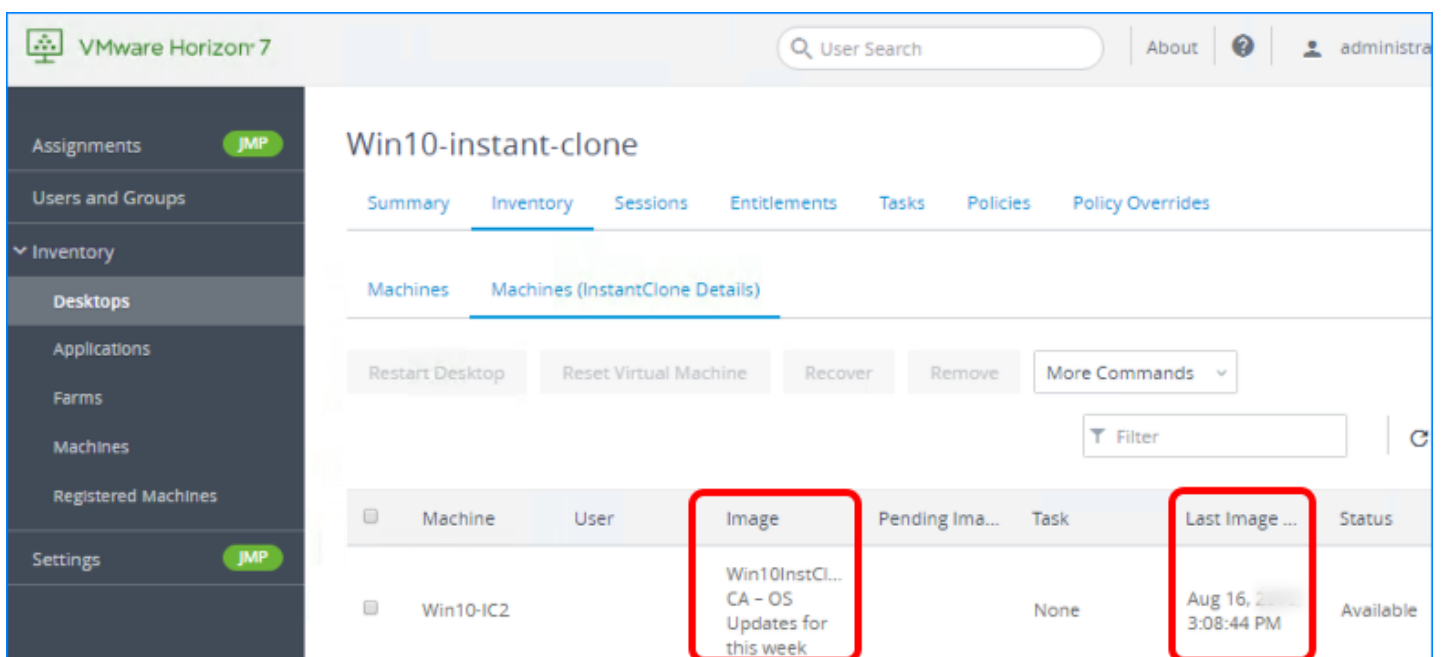

Show Details

Back Finish Cancel

Click **Finish**. You are returned to the **Summary** tab for the desktop pool, where the pending image for the push operation is displayed in the vCenter Server panel. The state changes from **Publishing** to **Published**.

## 6. Monitor Progress for Individual Desktops

Click the **Machines (InstantClone Details)** tab to monitor which individual desktops are using which image.

# Deploy a Full-Clone Desktop Pool

A full clone is an independent copy of a VM. It shares nothing with its master VM, and it operates entirely separately from the master VM used to create it. In this exercise, you create full-clone desktops with dedicated user assignment.

Before Horizon 7 was released, full-clone dedicated desktops were created for users who needed to install their own applications. This requirement was weighed against the management overhead required to maintain each individual full clone and all the data and applications installed in the VM.

With Horizon 7 and App Volumes, you have the alternative of creating Just-in-Time Desktops. You can combine instant-clone desktops with App Volumes writable disks, which allow users to install their own applications. This strategy allows you to create disposable desktops that retain user customizations, personas, and user-installed apps from session to session, even though the cloned desktop is destroyed when the user logs out. Users experience a stateful desktop, while the enterprise realizes the economy of stateless desktops. For more information, see [JMP and VMware Horizon 7 Deployment Considerations](#).

## Prerequisites for Deploying a Full-Clone Pool

To perform this exercise, you need the following:

- **Master VM template** – Before you can deploy a pool of full-clone desktops, you must create an optimized master image, which includes installing and configuring a Windows operating system in a VM, optimizing the OS, and installing the various VMware agents required for desktop pool deployment. For step-by-step instructions, see the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#).

**Important:** Follow the instructions in the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#), but instead of taking a snapshot of the VM after you finish creating and optimizing it, you must clone the VM to a VM template. For instructions, see the vSphere product documentation topic [Clone a Virtual Machine to a Template in the vSphere Web Client](#). When creating instant-clone and linked-clone desktops, you use a VM snapshot, but for full-clone desktops, you must use a VM template instead of a snapshot.

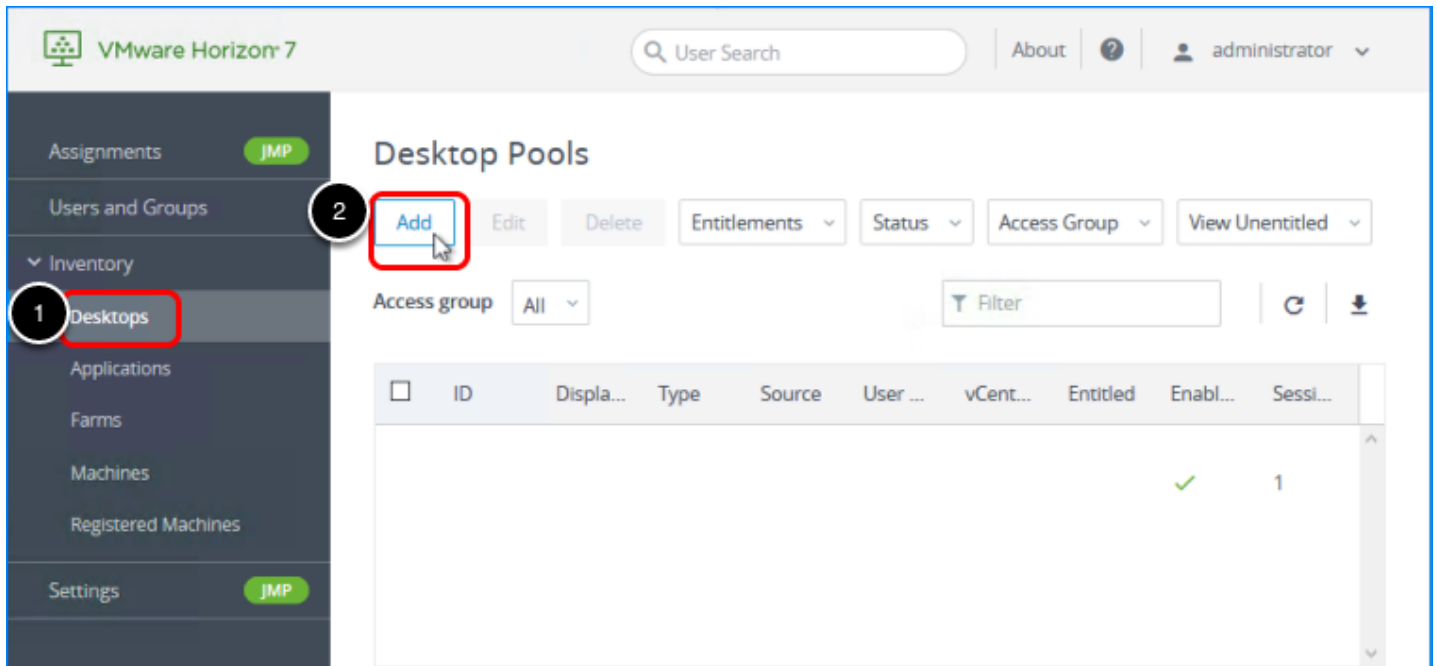

- **Microsoft Sysprep customization specification** – If you do not already have a Microsoft Sysprep customization specification for the Windows 10 guest operating system, use the Guest Customization wizard in the vSphere Client to create one. See the vSphere product documentation topic [Create a Customization Specification for Windows](#). You will select this customization specification when completing the Add Desktop Pool wizard.

**Note:** VMware recommends that you test a customization specification in vSphere before you use it to create a desktop pool. When you use a Sysprep customization specification to join a Windows desktop to a domain, you must use the FQDN of the Active Directory domain. You cannot use the NetBIOS name.

- **Connection Server** – For installation and setup instructions, see the exercises [Install Horizon Connection Server](#), [Add the Product License Key](#), and [Add a vCenter Server Instance](#).
- **VM folder** – (Optional) A VM folder in the vCenter Server inventory. Having a specific folder in the vCenter Server inventory helps you locate and manage the virtual desktops in the full-clone pool.

## 1. Start the Add Pool Wizard in the Horizon Console

1. Log in to the Horizon Console, and select **Inventory > Desktops**.  
The format of the URL for accessing the console is:  
`https://<connection-server-FQDN>/newadmin`
2. Click **Add**.

## 2. Select the Automated Desktop Pool Type

The screenshot shows the 'Add Pool' wizard in VMware Horizon 7. The wizard has a left-hand navigation pane with six steps: 1. Type, 2. vCenter Server, 3. User Assignment, 4. Storage Optimization, 5. vCenter Settings, and 6. Desktop Pool Identification. Step 1 is currently active. In the main area, there are two radio button options: 'Automated desktop pool' (which is selected and highlighted with a red rectangle) and 'RDS desktop pool'. At the bottom right, there are three buttons: 'Cancel', 'Previous', and 'Next'. The 'Next' button is highlighted with a red rectangle and a mouse cursor, and it is also labeled with a circled '2'.

1. Select Automated Desktop Pool.
2. Click Next.

### 3. Select the Full Clone Type and the vCenter Server Instance

**Add Pool**

1 ☐ Instant Clone  
☒ **Full Virtual Machines**

2 **vc-desktops...**

3 **Next**

Cancel Previous

1. Select **Full Virtual Machines**, and, optionally, add a description of the pool.
2. Select the vCenter Server instance.
3. Click **Next**.

## 4. Enable Automatic Assignment

**Add Pool**

✓ Type

✓ vCenter Server

3 User Assignment

4 Storage Optimization

5 vCenter Settings

6 Desktop Pool Identification

Dedicated

1 ☒ Allow automatic assignment

2

Cancel Previous Next

1. Select **Allow automatic assignment**.
2. Click **Next**.

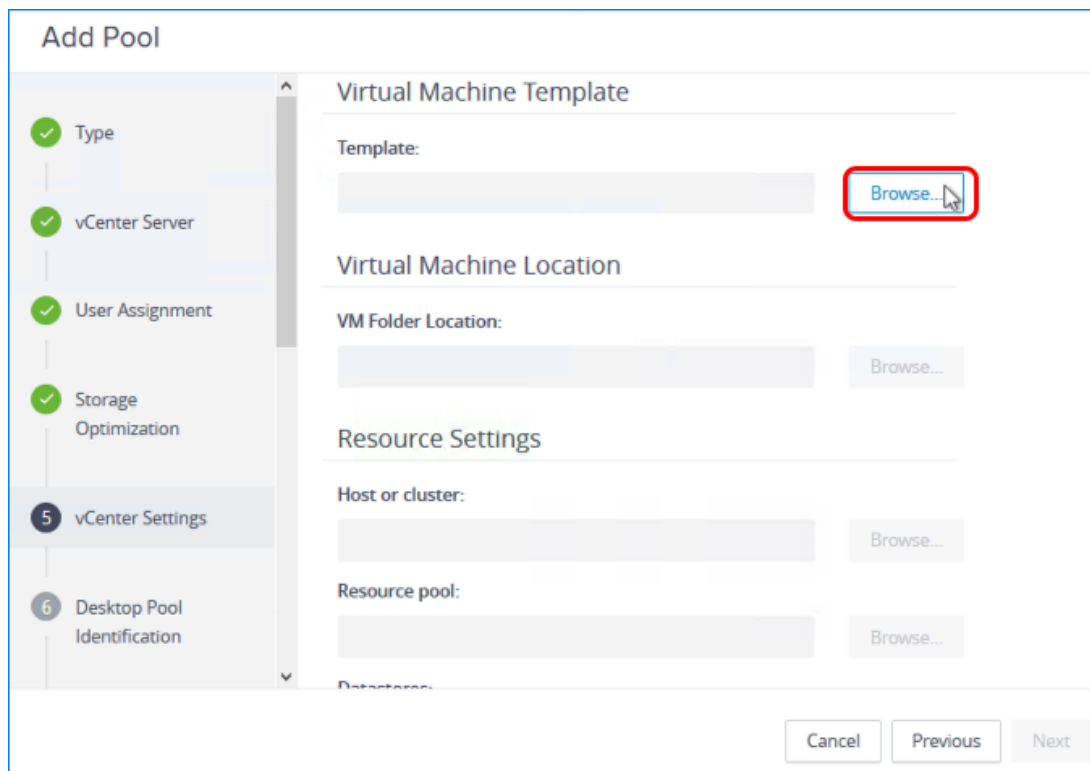

## 5. Choose Whether to Use vSAN

The screenshot shows the 'Add Pool' wizard in VMware Horizon. The wizard consists of six steps: Type, vCenter Server, User Assignment, Storage Optimization, vCenter Settings, and Desktop Pool Identification. The 'Storage Optimization' step is currently active. In this step, there are two radio buttons: 'Use VMware Virtual SAN' and 'Do not use VMware Virtual SAN'. The 'Do not use VMware Virtual SAN' option is selected, and it is highlighted with a red box. A circular callout with the number '1' points to this option. At the bottom right of the wizard, there are three buttons: 'Cancel', 'Previous', and 'Next'. The 'Next' button is highlighted with a red box, and a circular callout with the number '2' points to it.

1. Select Do not use VMware Virtual SAN.
2. Click Next.

In a production environment, you might select to use VMware Virtual SAN. VMware Virtual SAN, or [VMware vSAN™](#), is a software-defined storage tier that virtualizes the local physical storage disks available on a cluster of vSphere hosts. You specify only one datastore when creating an automated desktop pool or an automated farm, and the various components, such as virtual machine files, replicas, user data, and operating system files, are placed on the appropriate solid-state drive (SSD) disks or direct-attached hard disks (HDDs).

## 6. Complete the Virtual Machine Template Settings

The screenshot shows the 'Add Pool' wizard in VMware Horizon. The left sidebar lists the steps: Type, vCenter Server, User Assignment, Storage Optimization, vCenter Settings (current step, marked with a '5'), and Desktop Pool Identification (marked with a '6'). The main content area is titled 'Virtual Machine Template' and contains the following sections:

- Virtual Machine Template:** A text field for 'Template:' with a 'Browse...' button next to it. The 'Browse...' button is circled in red.
- Virtual Machine Location:** A text field for 'VM Folder Location:' with a 'Browse...' button next to it.
- Resource Settings:**
  - A text field for 'Host or cluster:' with a 'Browse...' button next to it.
  - A text field for 'Resource pool:' with a 'Browse...' button next to it.

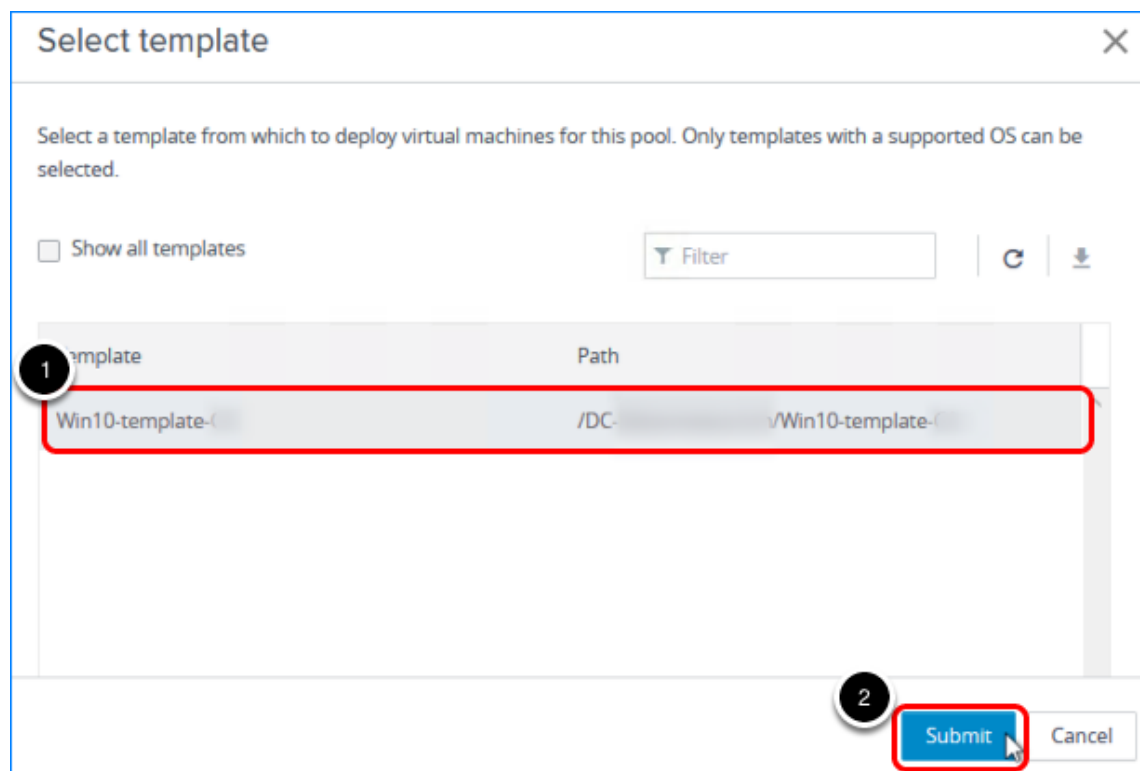

At the bottom right, there are three buttons: 'Cancel', 'Previous', and 'Next'.

Click the **Browse** button next to the first setting, which is **Template**.

**Important:** This page has numerous settings, and in the next steps, we do not copy this screenshot into every step, but instead only refer to it and show a screenshot of the window that appears when you click **Browse** for that setting.

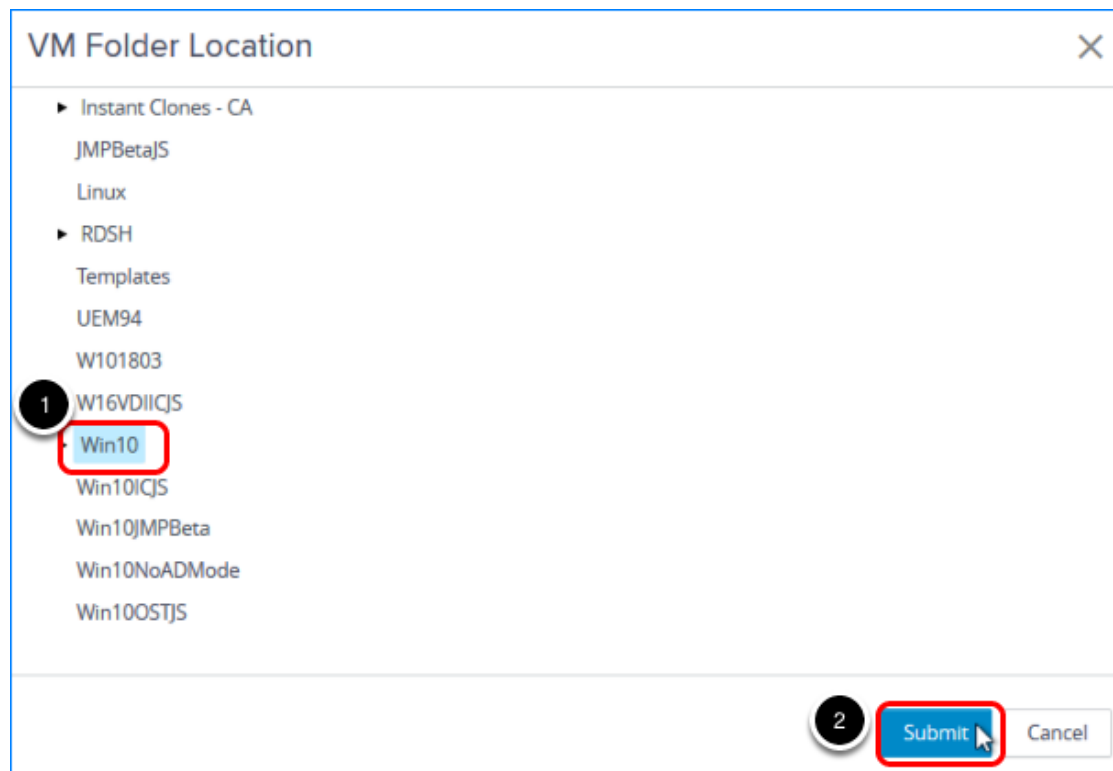

Describing all the settings in detail is beyond the scope of this quick-start guide. For details about all the settings in the Add Desktop wizard, see the product documentation topic [Worksheet for Creating an Automated Pool That Contains Full Virtual Machines in Horizon Console](#).

## 6.1. Select a VM Template

1. Select the VM template that you created.  
For instructions on creating and optimizing a VM, see the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#). For instructions on creating a VM template, see the vSphere product documentation topic [Clone a Virtual Machine to a Template in the vSphere Web Client](#).
2. Click Submit.

## 6.2. Select a VM Folder for the Full Clones in the Pool

1. Click **Browse** next to **VM Folder Location**, and select the folder to use.  
**Note:** The **Win10** folder shown in the screenshot is just an example; you can select any available folder.  
The VM folder is described in [Prerequisites for Deploying a Full-Clone Pool](#).
2. Click **Submit**.

## 6.3. Select the Resource Cluster

1. Click **Browse** next to **Cluster**, and select a vCenter Server resource cluster.  
**Note:** The cluster selected in the screenshot is just an example; you can select any available cluster.
2. Click **Submit**.

## 6.4. Select a Resource Pool

1. Click **Browse** next to **Resource Pool**, and select a resource pool.  
**Note:** The resource pool selected in the screenshot is just an example; you can select any available resource pool.
2. Click **Submit**.

## 6.5. Select a Datastore for the Clones

Select Datastores

Select the Datastore type: Individual Datastore

Select the datastores to use for this desktop pool. Only datastores that can be used by the selected host or cluster can be selected.

<input type="checkbox"/>	Datastore	Capacity(GB)	Free(GB)	FS Type	Drive Type
<input type="checkbox"/>	t3600-01-Beta-VDI-4-1	2047.75 GB	1587.79 GB	VMFS6	Non-SSD
<input checked="" type="checkbox"/>	t3600-01-Beta-VDI-4-2	2047.75 GB	1724.41 GB	VMFS6	Non-SSD
<input type="checkbox"/>	t3600-01-ISOs	1023.75 GB	798.46 GB	VMFS6	Non-SSD
<input type="checkbox"/>	w3-eucvra-bl-25_local	271.25 GB	269.84 GB	VMFS6	Non-SSD

2 Submit Cancel

1. Click **Browse** next to **Datastores**, and select a datastore.
2. **Note:** The datastore selected in the screenshot is just an example; you can select any available datastore or multiple datastores.
3. Click **Submit**.

## 6.6. Click Next on the Virtual Machine Template Page

**Add Pool**

- ✓ Type
- ✓ vCenter Server
- ✓ User Assignment
- ✓ Storage Optimization
- 5 vCenter Settings**
- 6 Desktop Pool Identification

**Virtual Machine Location**

VM Folder Location: /DC- /vm/Win10

**Resource Settings**

Host or cluster: /DC- /host/Desktops-4

Resource pool: /DC- /host/Desktops-4/Resources

Datastores: 1 selected

On the page that summarizes the default image settings you selected, click **Next**.

## 7. Enter a Pool ID and Display Name

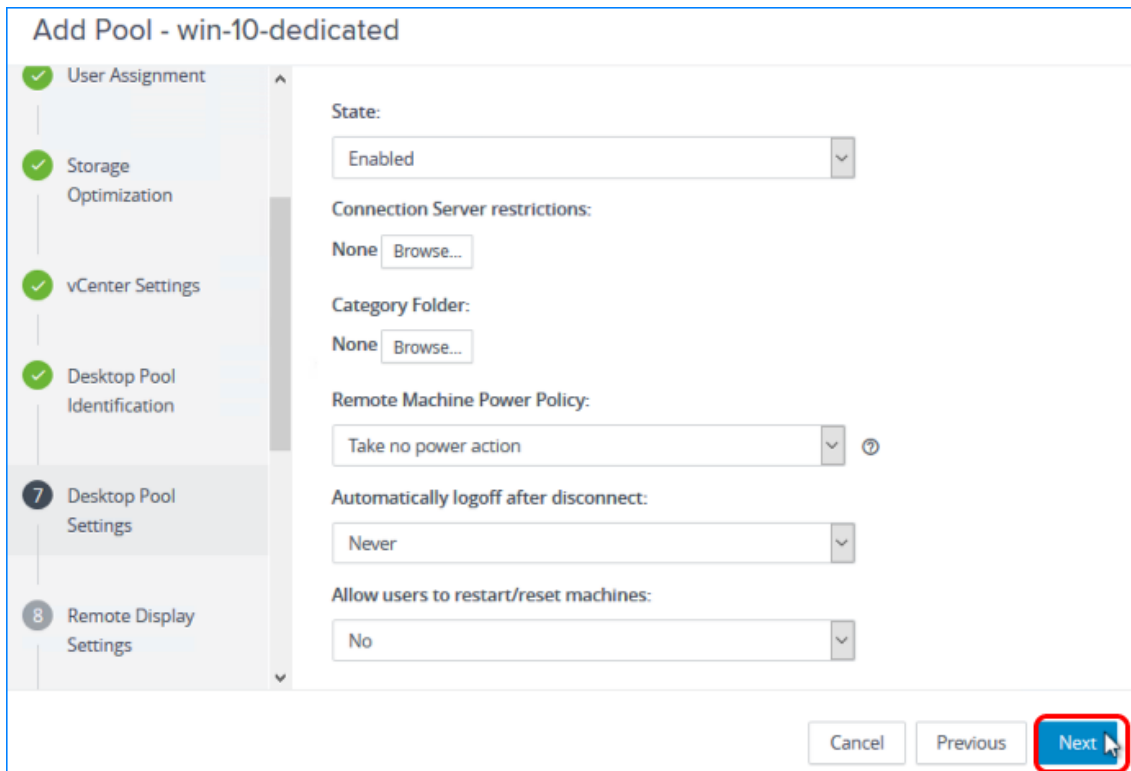

The screenshot shows the 'Add Pool - win-10-dedicated' wizard. The left sidebar lists the steps: vCenter Server, User Assignment, Storage Optimization, vCenter Settings, Desktop Pool Identification (step 6), and Desktop Pool Settings (step 7). The main area contains the following fields:

- ID:** win-10-dedicated
- Display name:** Dedicated Windows 10 VM
- Access group:** /
- Description:** (empty text area)

At the bottom right, there are three buttons: Cancel, Previous, and Next. The Next button is highlighted with a red box and a number 4.

1. Add a pool ID.
2. (Optional) Add a display name, which users will see when they log in using Horizon Client or the HTML Access web client.  
If you do not provide a display name, the pool ID is used for the display name.
3. (Optional) Select an access group.  
If you do not specify an access group, the pool is placed in the root access group. For more information about access groups, see the product documentation topic [Manage and Review Access Groups](#).
4. Click **Next**.

## 8. Specify Desktop Pool Settings

The screenshot shows the 'Add Pool - win-10-dedicated' wizard. On the left, a sidebar lists the steps: User Assignment (checked), Storage Optimization (checked), vCenter Settings (checked), Desktop Pool Identification (checked), Desktop Pool Settings (highlighted with a '7'), and Remote Display Settings (highlighted with an '8'). The main area displays the settings for the 'Desktop Pool Settings' step:

- State:** Enabled (dropdown menu)
- Connection Server restrictions:** None (dropdown menu) with a 'Browse...' button.
- Category Folder:** None (dropdown menu) with a 'Browse...' button.
- Remote Machine Power Policy:** Take no power action (dropdown menu) with a help icon.
- Automatically logoff after disconnect:** Never (dropdown menu)
- Allow users to restart/reset machines:** No (dropdown menu)

At the bottom right, there are three buttons: 'Cancel', 'Previous', and 'Next'. The 'Next' button is highlighted with a red rectangle and a mouse cursor is pointing at it.

For the purposes of this exercise, use the default settings, and click Next.

## 9. Specify Remote Display Settings

**Add Pool - win-10-dedicated**

Manage using vSphere Client

vRAM Size: 96

Max number of monitors: 2

May require power-cycle of related virtual machines

Max resolution of any one monitor: 1920x1200

May require power-cycle of related virtual machines

1 **HTML Access:** ☒ Enabled

Requires installation of HTML Access.

2 **Allow Session Collaboration:** ☒ Enabled

Requires VMware Blast Protocol.

3 **Next**

1. Select the **HTML Access** check box so that users will be able to access virtual desktops using their web browsers in addition to Horizon Client.
2. Select **Allow Session Collaboration**.
3. Use the defaults for the other settings, and click **Next**.

## 10. Specify Provisioning Settings

**Add Pool - win-10-dedicated**

Start machines in maintenance mode

# Unassigned machines kept powered on: 1

1 ☒ Use a naming pattern  
Win-10-FC

2 **Provisioning Timing**  
☒ Provision machines on demand  
Min number of machines: 1  
☐ Provision all machines up-front

3 **Desktop Pool Sizing**  
\* Max number of machines: 10  
\* Number of spare (powered on) machines: 1

4

5 Cancel Previous **Next**

1. Enter a naming pattern for the VMs. For example, for this exercise, you can use `Win10-FC`. This naming pattern helps you identify Windows 10 full clones in Horizon Console.
2. Select **Provision machines on demand**, and use the default minimum of 1.
3. Set **Max number of machines** to 10 or fewer (for the purposes of this exercise). In a production environment, full-clone pools have been tested to support up to 2,000 desktops.
4. Set **Number of spare (powered on) machines** to 1.
5. Use the defaults for the other settings, and click **Next**.

# 11. Click Next on the Advanced Storage Options Page

AddToDomain-DHCP	Windows	

2

3

Cancel Previous Next

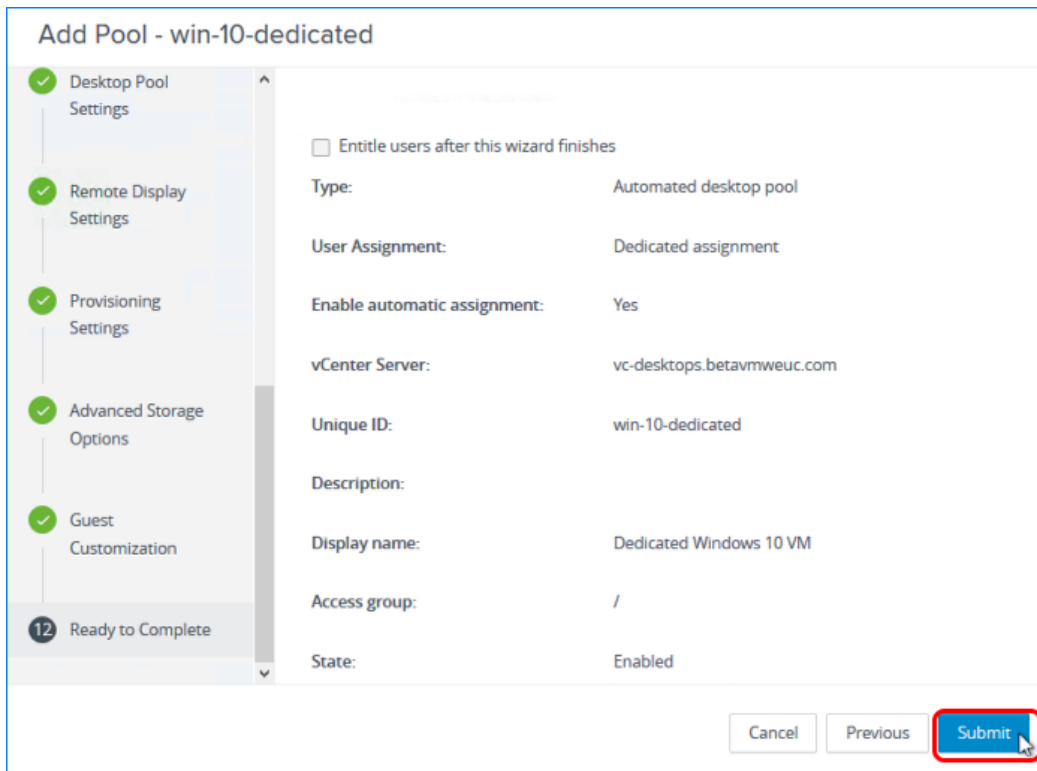

1. Select Use this customization specification.

2. Select the customization specification.

**Note:** The customization specification selected in the screenshot is just an example; select the customization specification you created.

3. Click **Next**.

## 13. Begin Deploying the Desktop Pool

**Add Pool - win-10-dedicated**

☐ Entitle users after this wizard finishes

Type: Automated desktop pool

User Assignment: Dedicated assignment

Enable automatic assignment: Yes

vCenter Server: vc-desktops.betavmweuc.com

Unique ID: win-10-dedicated

Description:

Display name: Dedicated Windows 10 VM

Access group: /

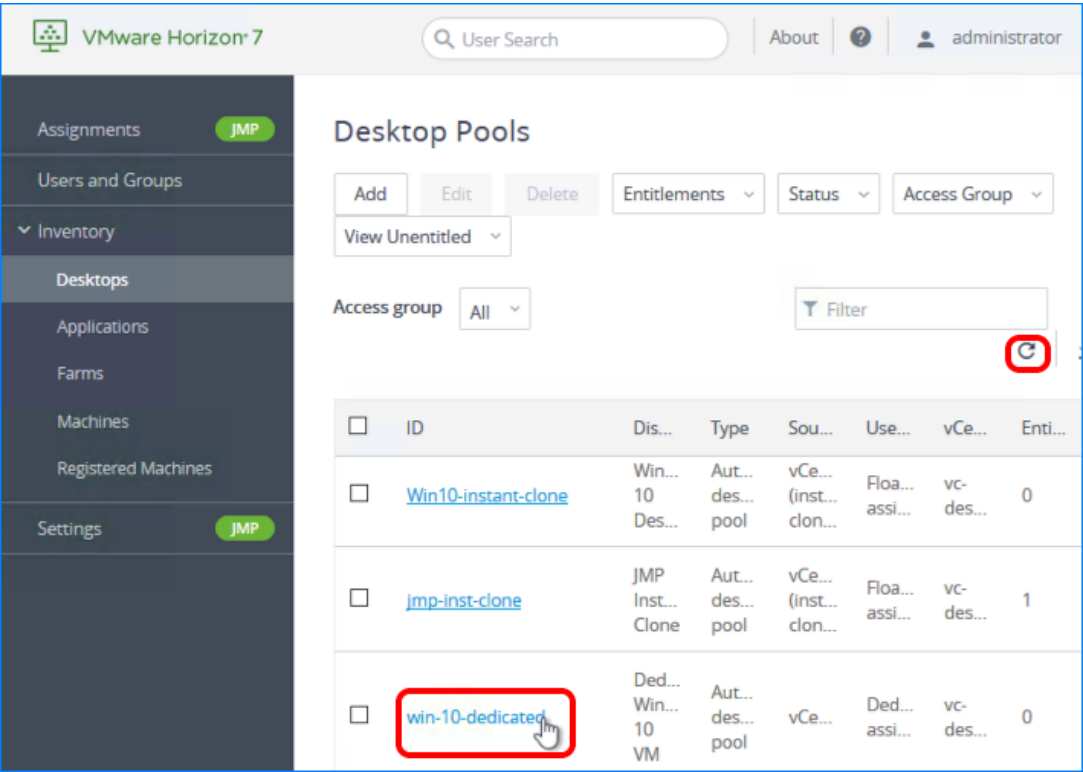

State: Enabled

Buttons: Cancel, Previous, **Submit**

Leave the check box at the top of the window de-selected, and click **Submit**. Entitling users is a separate exercise.

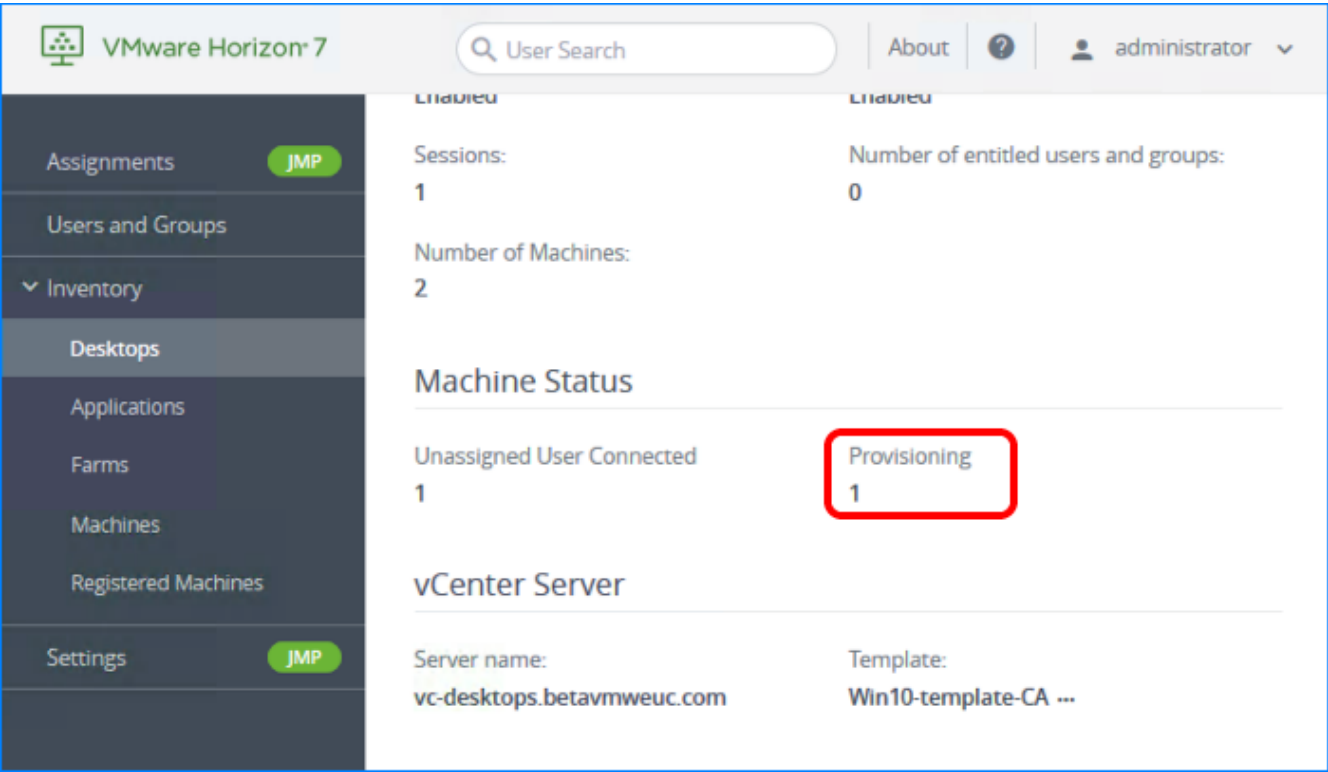

For more information about the available settings in this wizard, see the product documentation topic [Worksheet for Creating an Automated Pool That Contains Full Virtual Machines in Horizon Console](#).

# 14. Monitor the Pool Creation Process

To access details about the newly added pool, click the pool name on the Desktop Pools page. If you do not see the pool listed, click the Refresh icon above the table.

# 15. Check the Machine Status

Scroll down to the Machine Status area, which displays the VM state. The state changes from Provisioning to Customizing to Available .

# Deploy a Linked-Clone Desktop Pool

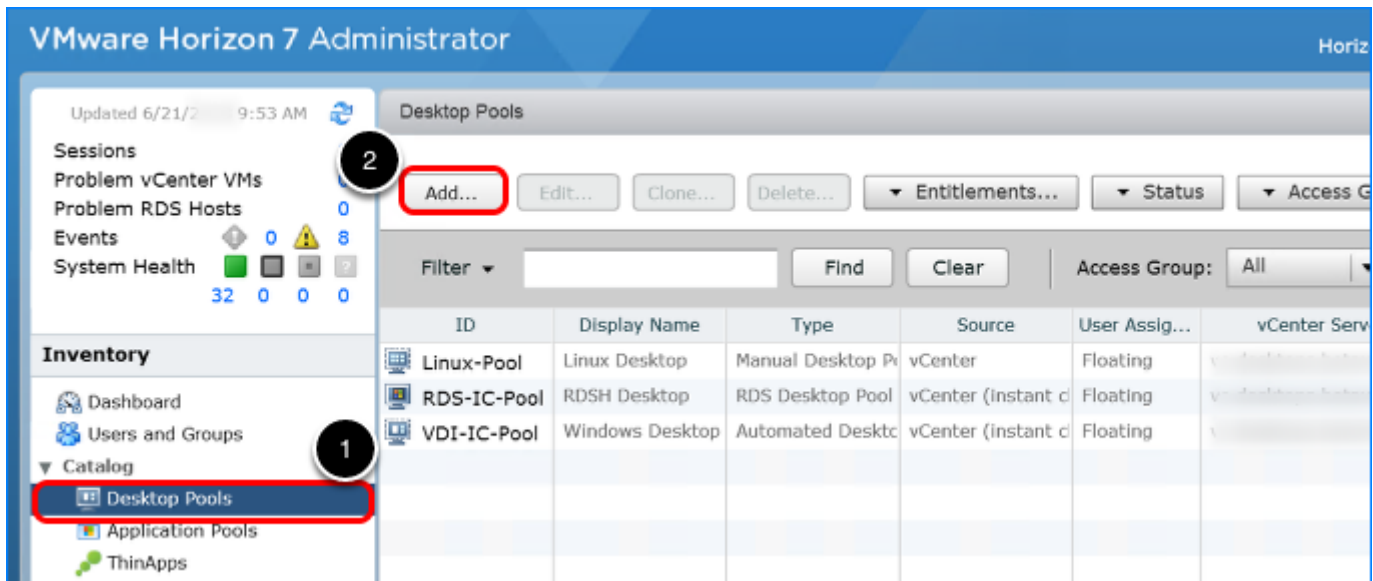

Linked clones allow administrators to easily create and manage pools of similar desktops. Because linked-clone desktops share a base system-disk image, they use less storage than full VMs. All linked-clone desktops can be patched or updated by updating the master VM and VM snapshot.

## Prerequisites for Deploying a Linked-Clone Pool

To perform this exercise, you need the following:

- **Master VM and snapshot** – Before you can deploy a pool of desktops, you must create an optimized master image, which includes installing and configuring a Windows operating system in a VM, optimizing the OS, and installing the various VMware agents required for desktop pool deployment. For step-by-step instructions, see the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#).
- **AD OU** – You must have determined which Active Directory OU to use for storing linked-clone computer accounts. In a test environment, you can use the Computers OU. In a production environment, VMware recommends that you create a specific OU and domain user, and delegate the minimum required permissions, as described in the exercise [Create a Domain User Account and OUs in AD for Clone Operations](#).
- **Connection Server** – For installation and setup instructions, see the exercises [Install Horizon Connection Server](#) and [Add the Product License Key](#).
- **Composer server** – For installation and setup instructions, see the exercises [Install the Composer](#) and [Add a vCenter Server Instance](#).
- **VM folder** – (Optional) A VM folder in the vCenter Server inventory. Having a specific folder in the vCenter Server inventory helps you locate and manage the virtual desktops in the linked-clone pool.

## 1. Start the Add Pool Wizard in Horizon Administrator

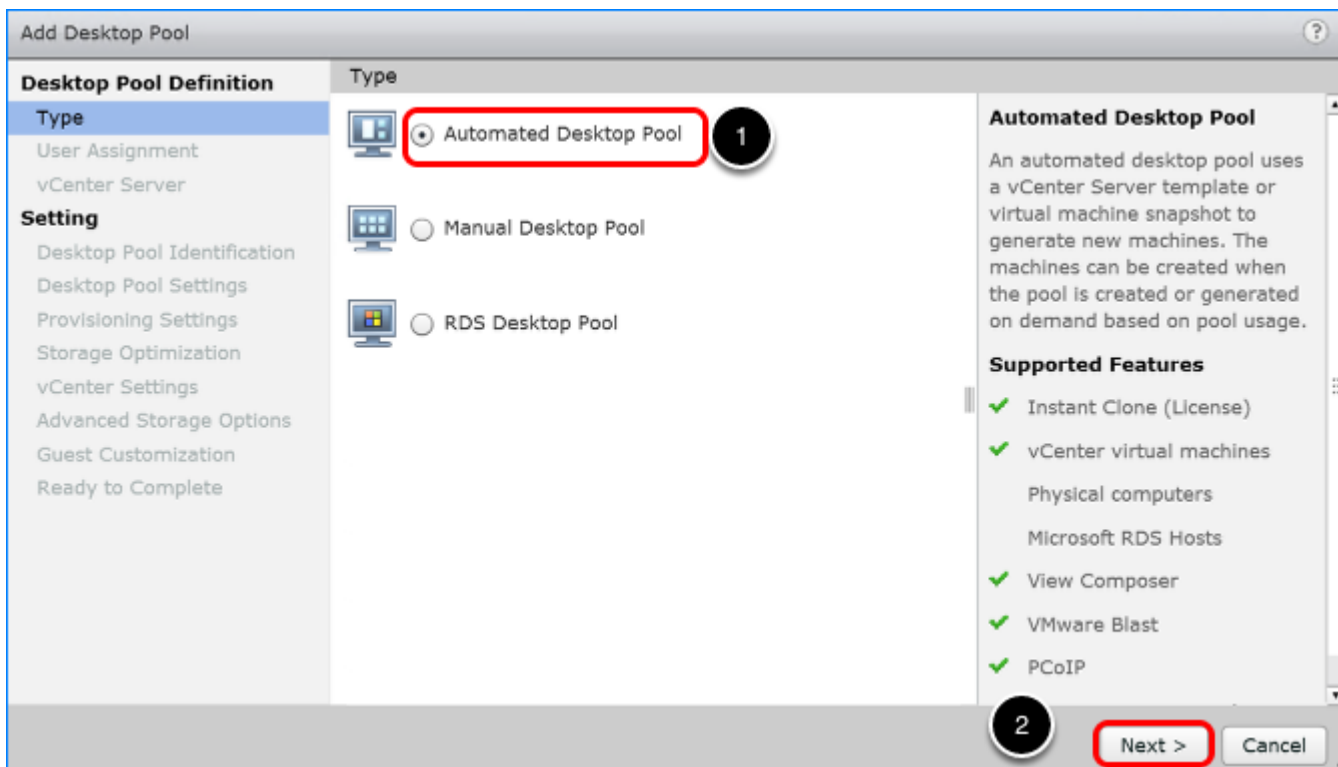

1. Log in to Horizon Administrator, and navigate to Catalog > Desktop Pools.

The format of the URL for accessing the console is:

<https://<connection-server-FQDN>/admin>

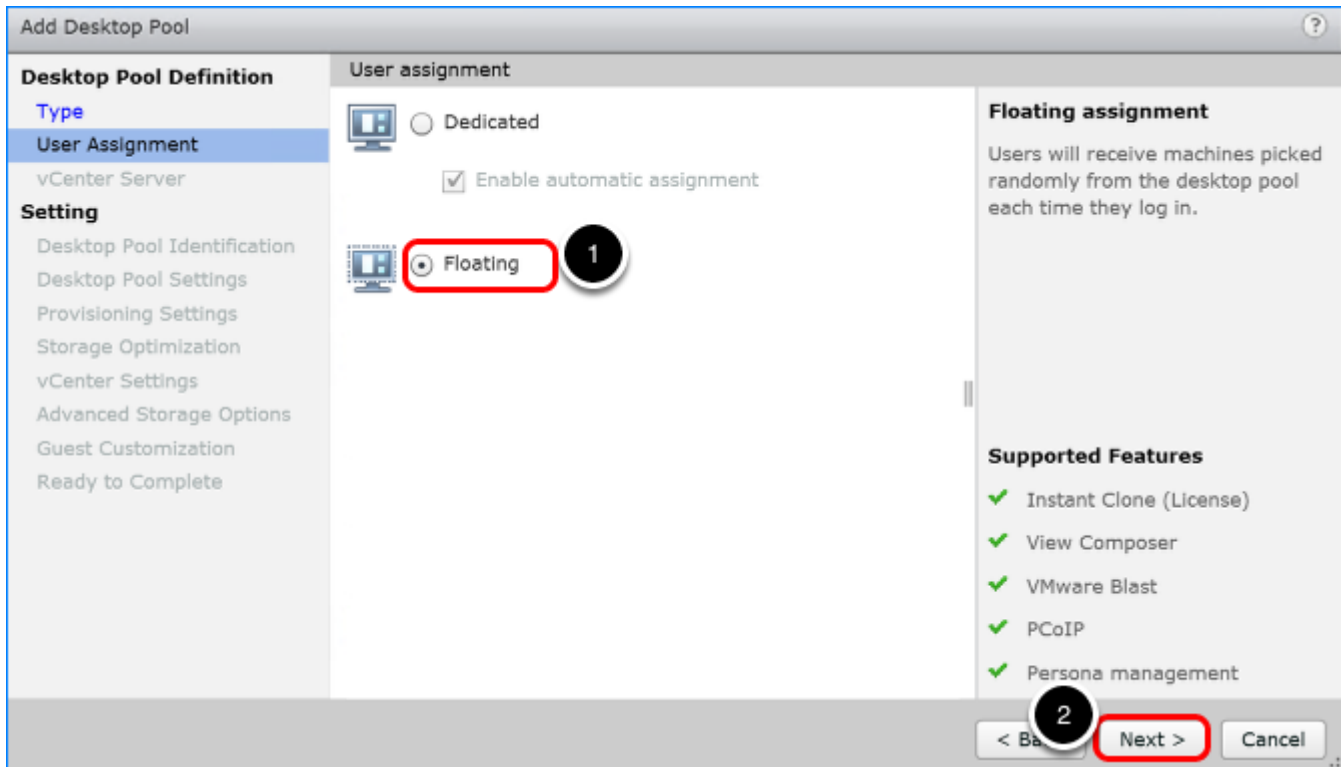

2. Click Add.

## 2. Select the Automated Desktop Pool Type

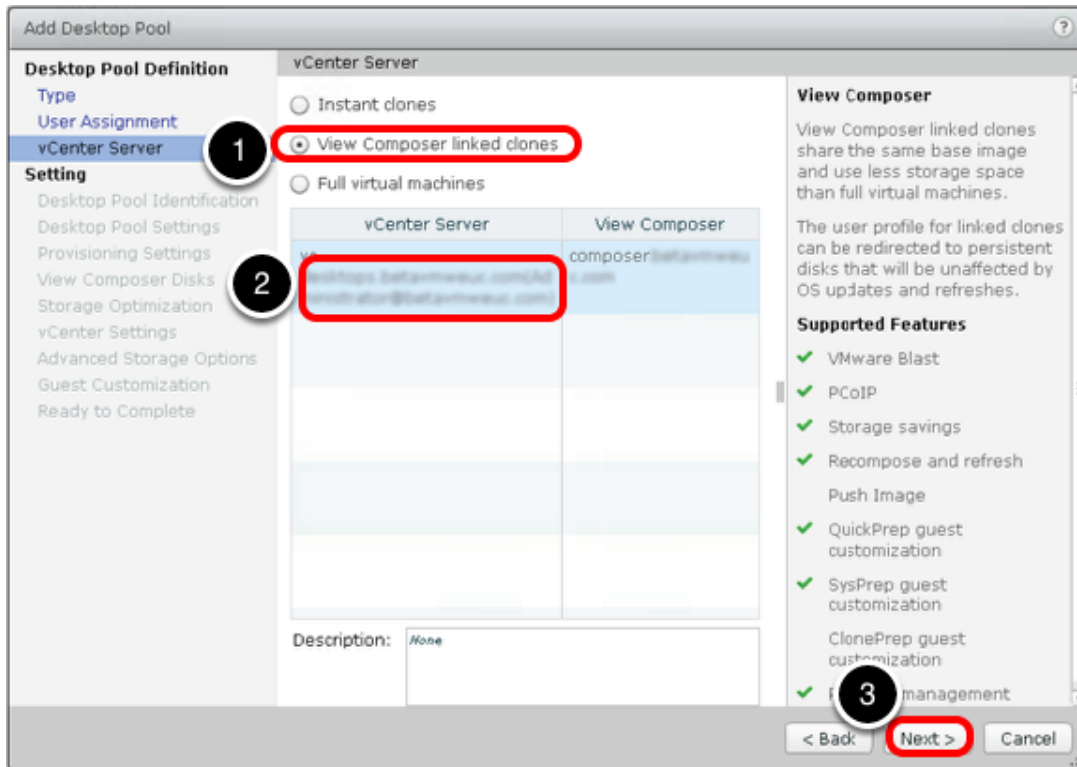

1. Select Automated Desktop Pool.
2. Click Next.

### 3. Select Floating Assignment

1. Select **Floating**. Linked-clone pools can use either floating or dedicated user assignment. For this exercise, we use floating assignment.
  - **Dedicated assignment**: Each desktop is assigned to a specific user. A user logging in for the first time gets a desktop that is not assigned to another user. The user always gets this same desktop after logging in, and this desktop is not available to any other user.
  - **Floating assignment**: Users get a random desktop every time they log in. When a user logs out, the desktop is either refreshed and returned to the pool or deleted, depending on pool settings. With automatic deletion, you keep only as many VMs as you need at one time.
2. Click **Next**.

## 4. Connect to vCenter

1. Select View Composer linked clones.
2. Select the vCenter Server instance.
3. Click Next.

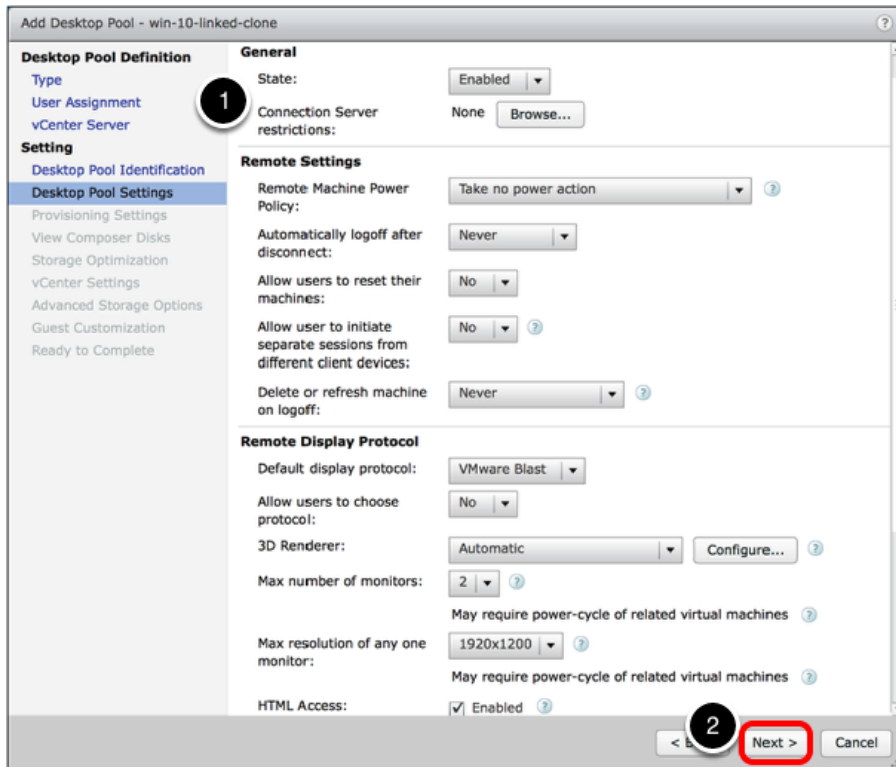

## 5. Provide a Pool ID

The screenshot shows the 'Add Desktop Pool - win-10-linked-clone' wizard. The 'Desktop Pool Identification' tab is selected. The 'ID' field contains 'win-10-linked-clone', the 'Display name' field contains 'Windows 10 Linked Clone', and the 'Access group' field contains '/'. The 'Description' field is empty. A red box highlights these four fields. A red circle with the number '1' is next to the 'ID' field. A red circle with the number '2' is next to the 'Next >' button.

1. Complete the Desktop Pool Identification window:
  - Add a pool ID.
  - (Optional) Add a display name, which users will see when they log in using Horizon Client or the HTML Access web client.  
If you do not provide a display name, the pool ID is used for the display name.
  - (Optional) Select an access group.  
If you do not specify an access group, the pool is placed in the root access group. For more information about access groups, see the product documentation topic [Manage and Review Access Groups](#).
2. In the lower right, click Next.

## 6. Configure Desktop Pool Settings

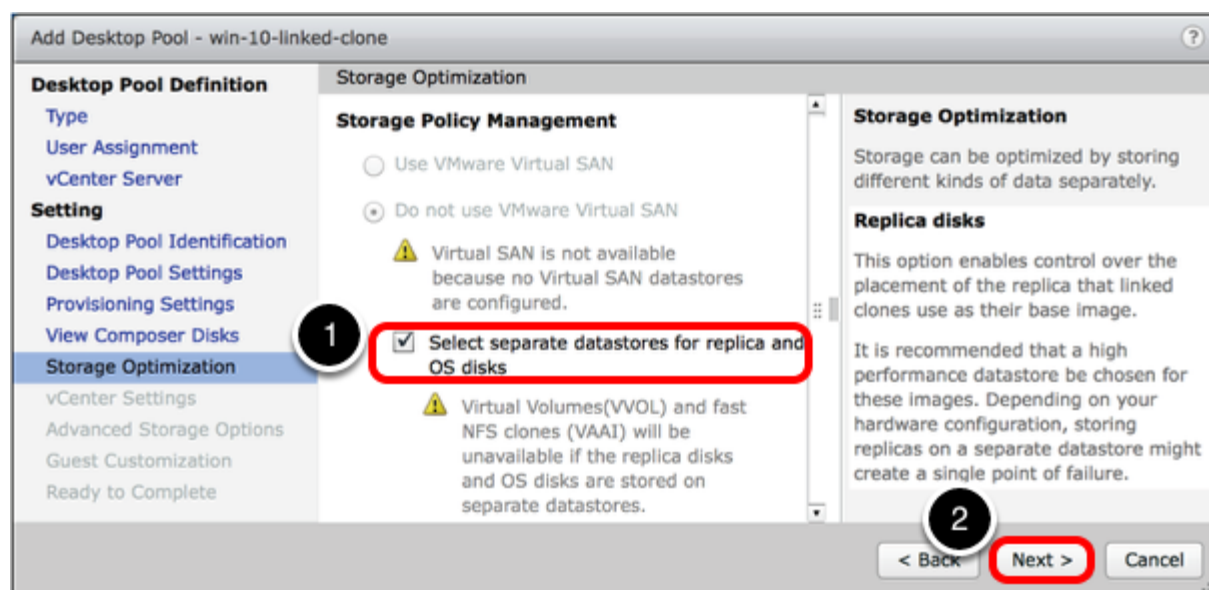

1. In the Desktop Pool Settings window, complete the following settings:
  - Leave **State** set to **Enabled**.
  - Select **VMware Blast** to use Blast Extreme as the default display protocol. You can use any display protocol, but the new Blast Extreme display protocol is optimized for all types of devices.
  - Set **HTML Access** to **Enabled**.  
Because you are enabling HTML Access, you can access your desktop from a browser if you do not want to install VMware Horizon Client later.
  - For assistance with selecting the other settings, click the ? icon next to the setting, or use the default setting.
2. Click **Next**.

## 7. Configure Provisioning Settings

1. In the Provisioning Settings window, change the following settings.
  - Enter a naming pattern for the VMs, as described in the Naming Pattern panel of the Provisioning Settings window. For example, for this exercise, you can use `Win-10-LC-`. This naming pattern helps you identify Windows 10 linked clones in Horizon Administrator.
  - Set **Max number of machines** to 10 or fewer (for the purposes of this exercise). In a production environment, linked-clone pools have been tested to support up to 2,000 desktops.
  - Select **Provision machines on demand**, and set the minimum number of machines to 2.
2. In the lower right, click **Next**.
3. In the View Composer Disks window, click **Next**.

Disposable files consist of the paging file and the system-level Temp directory. The default is to redirect disposable files to a nonpersistent disk that will be deleted automatically when a user's session ends.

## 8. Set Storage Optimization

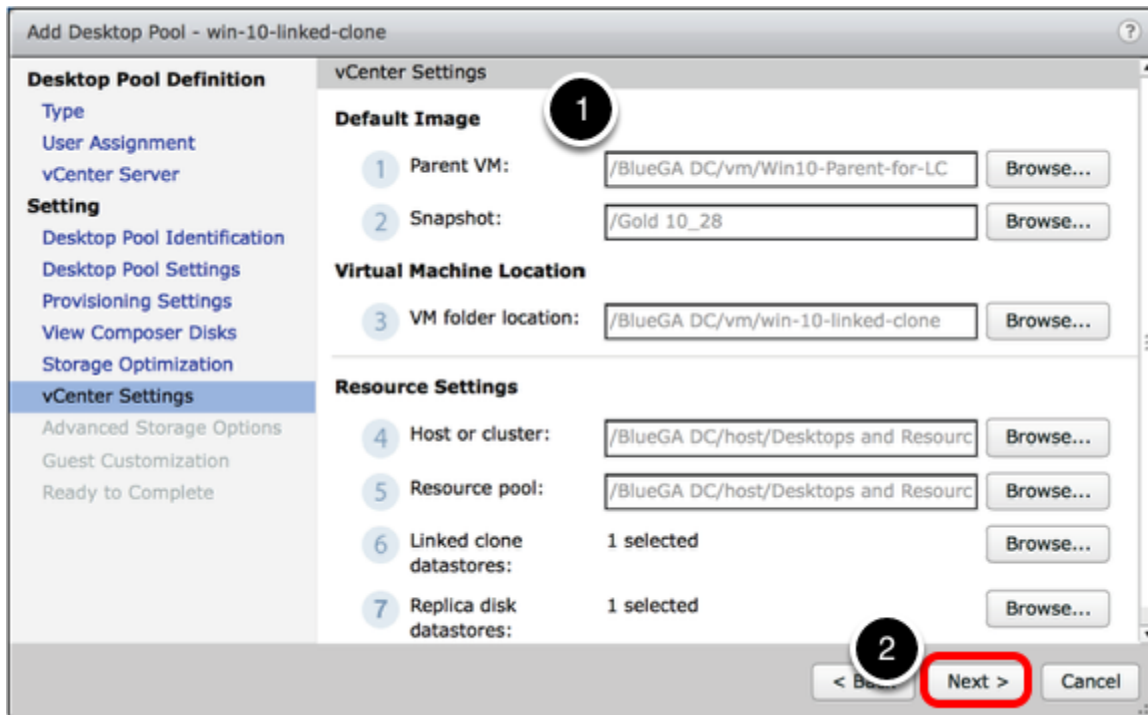

1. Select **Select separate datastores for replica and OS disks**.
2. Click **Next**.

For this exercise, use separate datastores so that you can see the extra settings in the next window. With separate datastores, you can place the replica VM on a solid-state, disk-backed datastore. Solid-state disks have low storage capacity but high read performance, typically supporting 20,000 IOPS. Separate datastores are used in tiered-storage models.

In a production environment, you might select to use VMware Virtual SAN. VMware Virtual SAN, or [VMware vSAN™](#), is a software-defined storage tier that virtualizes the local physical storage disks available on a cluster of vSphere hosts. You specify only one datastore when creating an automated desktop pool or an automated farm, and the various components, such as virtual machine files, replicas, user data, and operating system files, are placed on the appropriate solid-state drive (SSD) disks or direct-attached hard disks (HDDs).

## 9. Configure vCenter Settings

1. In the vCenter Settings window, click **Browse** next to each text box to make your selections. When making your selections, use the following guidelines:
  - **Parent VM:** Select the master VM that you created for linked clones in the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#).
  - **Snapshot:** Select the snapshot of the master VM that you created.
  - **VM folder location:** If you do not have a folder created, select the data center, and click OK.
  - **Linked clone datastores and Replica disk datastores:** If you are not using a tiered-storage model, you can select the same datastore for replicas and clones.
2. Click **Next**.
3. In the Advanced Storage Options window, click **Next**.

For the purposes of this exercise, you can use the defaults, but make sure to read the Advanced Storage Options window and the embedded help text in the window to learn about the storage features available for linked clones.

## 10. Configure Guest Customization

Add Desktop Pool - win-10-linked-clone

**Desktop Pool Definition**

- Type
- User Assignment
- vCenter Server

**Setting**

- Desktop Pool Identification
- Desktop Pool Settings
- Provisioning Settings
- View Composer Disks
- Storage Optimization
- vCenter Settings
- Advanced Storage Options
- Guest Customization**

Ready to Complete

**Guest Customization**

Domain: **1** Administrator

AD container: CN=Computers Browse...

☐ Allow reuse of pre-existing computer accounts

☒ Use QuickPrep

Power-off script name: Example: p1 p2 p3

Power-off script parameters: Example: p1 p2 p3

Post-synchronization script name: Example: p1 p2 p3

Post-synchronization script parameters: Example: p1 p2 p3

☐ Use a customization specification (SysPrep)

Name	Guest OS	Description
2012R2-server	Windows	
win7	Windows	
Windows-10-Spec	Windows	

**2** < Back Next > Cancel

1. In the Guest Customization window, use the following settings.

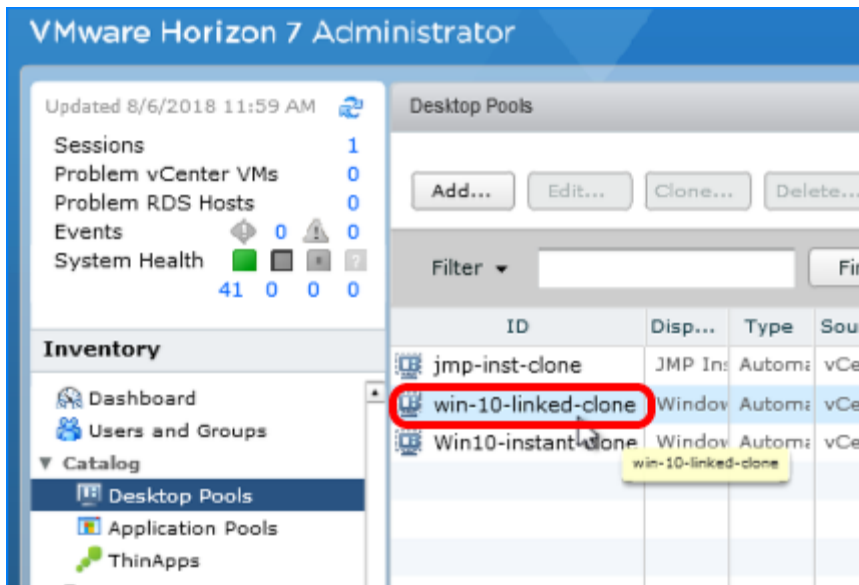

- **Domain:** Select the domain and user that were used when configuring View Composer settings.
- **AD container:** Click Browse and select the OU that you created in the exercise [Create a Domain User Account and OUs in AD for Clone Operations](#), or if this is a test environment, you can select the Computers OU.
- **Use QuickPrep:** Select this option. When you create linked-clone machines, you must modify each VM so that it can function as a unique computer on the network. QuickPrep and Microsoft Sysprep provide different approaches to customization. Because QuickPrep runs faster than Sysprep, and because QuickPrep does not require you to create a customization specification, use QuickPrep for this exercise.
- **Note:** For this exercise, you do not enter scripts. In a production environment, you can specify that a script run immediately after a clone is created. You can also run another script before the clone is powered off. These scripts can invoke any process that can be created with the Windows CreateProcess API, such as CMD, VBScript (VBS), EXE, and batch-file processes.

2. Click Next.

3. In the Ready to Complete window, click Finish.

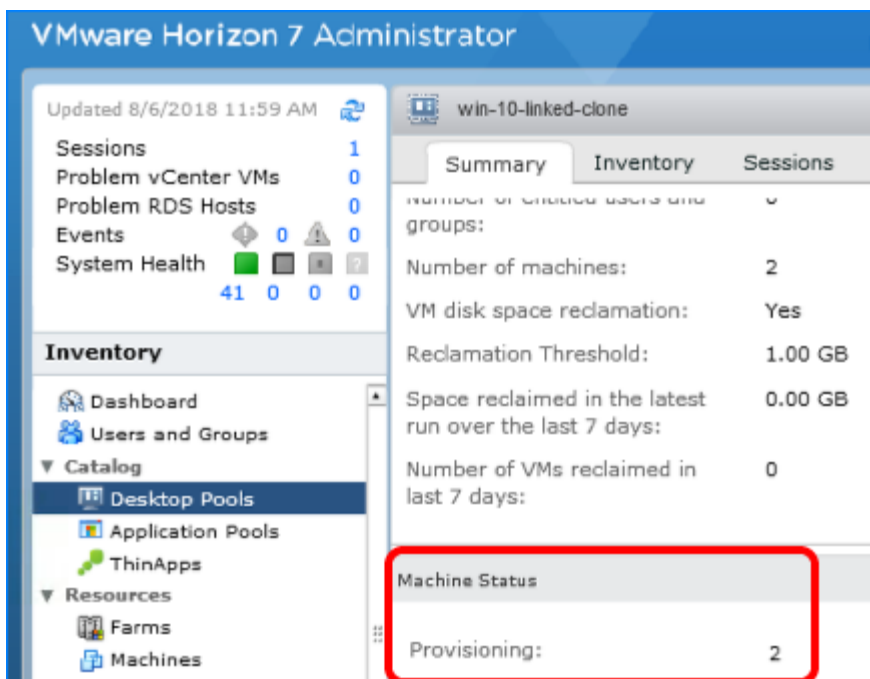

You return to the Catalog > Desktop Pools inventory list. The new pool appears in the list.

## 11. Monitor Progress by Going to the Summary Tab

Double-click the desktop pool to go to the Summary tab for the pool.

## 12. Check the Machine Status

Scroll down to the Machine Status area, which displays the VM state. The state changes from **Provisioning** to **Customizing** to **Available**.

**Note:** To create another linked-clone pool, you can select this pool in the Desktop Pools window and click **Clone** to clone this pool. The pool's settings are copied into the Add Desktop Pool

wizard, allowing you to create a new pool without having to fill in each setting manually. You can clone full-clone and linked-clone desktop pools.

# Creating RDSH-Published Desktops and Applications

# Introduction

Horizon 7 Published Desktops and Applications are based on sessions to RDSH servers. That is, administrators use Microsoft Remote Desktop Services (RDS) to provide users with desktop and application sessions on RDS hosts. Delivering published applications and desktops is a very simple process:

1. Create an RDSH server farm from a master VM image, which automatically clones the number of servers you specify.
2. Publish a desktop pool so that multiple users can access session-based shared desktops from RDSH servers.
3. Publish one or multiple application pools with one trip through the Add Application Pool wizard.
4. Learn how to perform image maintenance tasks for RDSH servers.

# Create an Instant-Clone RDSH Server Farm

A farm can contain from 1 to 200 RDSH servers. For the exercises in this guide, you create an automated farm of RDSH servers, which is similar to creating an automated pool of instant-clone desktops. With this feature, you do not need to create and configure each RDSH server separately.

For this exercise, you will use the newest Horizon 7 management interface, the Horizon Console.

**Important:** If your session in the Horizon Console is idle for more than a few minutes, you might be automatically logged out, and if you were in the middle of creating a server farm, your changes are lost.

## Prerequisites for Creating an Instant-Clone Server Farm

To perform this exercise, you need the following:

- **Master VM and snapshot** – Before you can deploy a farm of RDSH servers, you must create an optimized master image, which includes installing and configuring a Windows operating system in a VM, optimizing the OS, and installing the various VMware agents required for server farm deployment. For step-by-step instructions, see the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#).

**Important:** The master VM for RDSH servers must have the appropriate RDSH roles and services installed, as described in the section of that guide called [Configure Windows Server Systems for VDI or RDSH](#).

**Note:** It is also possible to enable Windows Server machines to be used as single-user desktops rather than RDSH servers, which provide session-based shared desktops. For information, see the product documentation topic [Prepare Windows Server Operating Systems for Desktop Use](#). None of the exercises that follow involves creating single-user desktops from Windows Server machines.

- **AD OU** – You must have determined which Active Directory OU to use for storing instant-clone computer accounts. In a test environment, you can use the Computers OU. In a production environment, VMware recommends that you create a specific OU and domain user, and delegate the minimum required permissions, as described in the exercise [Create a Domain User Account and OUs in AD for Clone Operations](#).

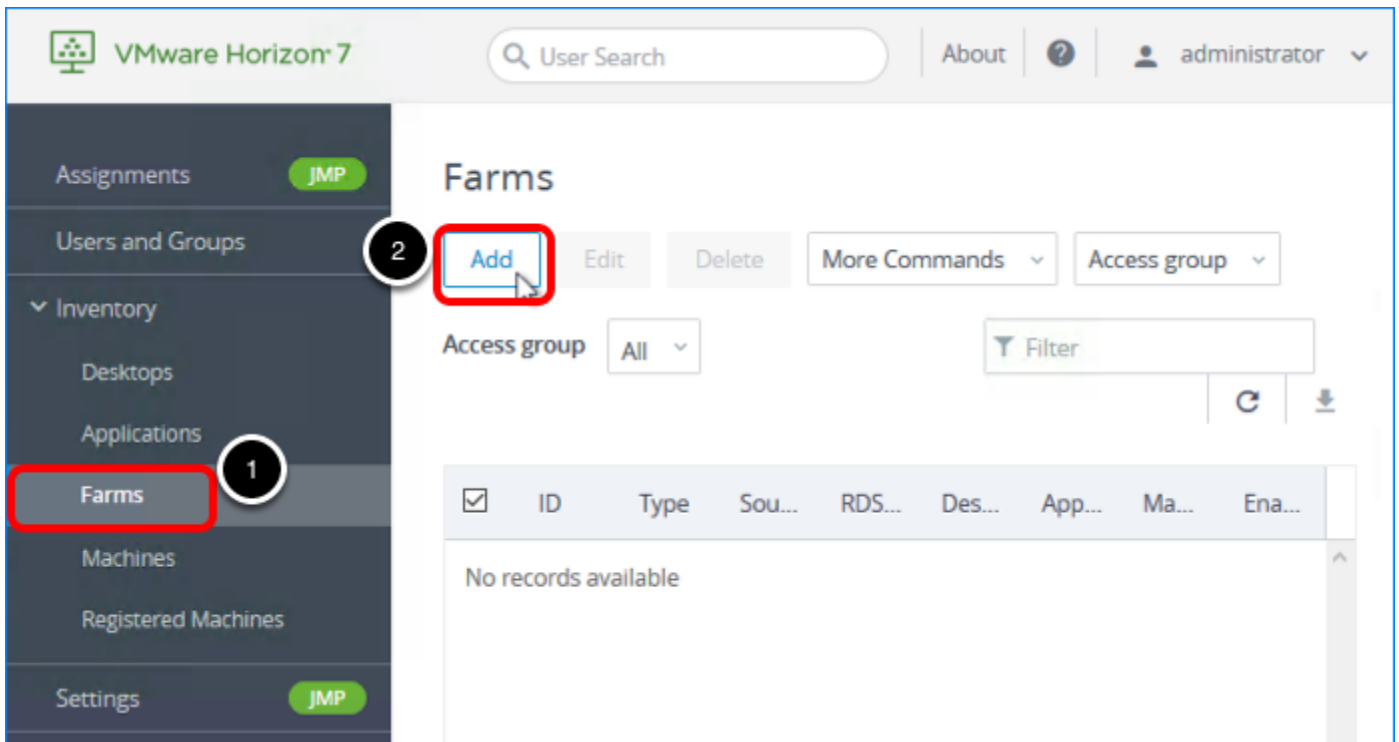

**Note:** For the server farm OU, give the OU a descriptive name such as `RDSH Servers`.

- **Instant-clone domain administrator** – You must have added an instant-clone domain administrator, as described in the exercise [Add an Instant-Clone Domain Administrator](#).
- **VM folder** – (Optional) A VM folder in the vCenter Server inventory. Having a specific folder in the vCenter Server inventory helps you locate and manage the RDSH servers in the instant-clone farm.
- **Applications** – The applications you provide to end users can be either installed directly on the RDSH server, or dynamically attached, as App Volumes AppStacks. Before you begin this exercise, install any applications that you want to have in the base image, available for all

users.

**Note:** To install applications directly on an RDSH server, place the host into RD-Install mode, install the desired applications, and place the host back into RD-Execute mode. For more information, see the Microsoft TechNet article [Learn How To Install Applications on an RD Session Host Server](#). If you plan to use AppStacks, be sure to install the App Volumes Agent, as described in the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#).

## 1. Start the Add Farm Wizard in the Horizon Console

1. Log in to the Horizon Console, and select Inventory > Farms.

The format of the URL for accessing the console is:

`https://<connection-server-FQDN>/newadmin`

2. Click Add.

## 2. Select the Automated Farm Type

The screenshot shows the 'Add Farm' wizard interface. On the left, a vertical list of steps is shown: 1 Type, 2 vCenter Server, 3 Storage Optimization, 4 vCenter Settings, 5 Identification and Settings, and 6 Provisioning Settings. Step 1 is highlighted. In the main area, under the 'Type' section, there are two radio button options: 'Automated Farm' (which is selected and highlighted with a red box) and 'Manual Farm'. At the bottom right, there are three buttons: 'Cancel', 'Previous' (disabled), and 'Next' (highlighted with a red box and a mouse cursor). A black circle with the number '1' points to the 'Automated Farm' radio button, and another black circle with the number '2' points to the 'Next' button.

1. Select Automated Farm.
2. Click Next.

### 3. Select the vCenter Server Instance

**Add Farm**

- 1 Type
- 2 vCenter Server**
- 3 Storage Optimization
- 4 vCenter Settings
- 5 Identification and Settings
- 6 Provisioning Settings

vCenter Server

vc-desktops.1.com

Description:

Cancel Previous **Next**

1. Select the vCenter Server instance.
2. Click **Next**.

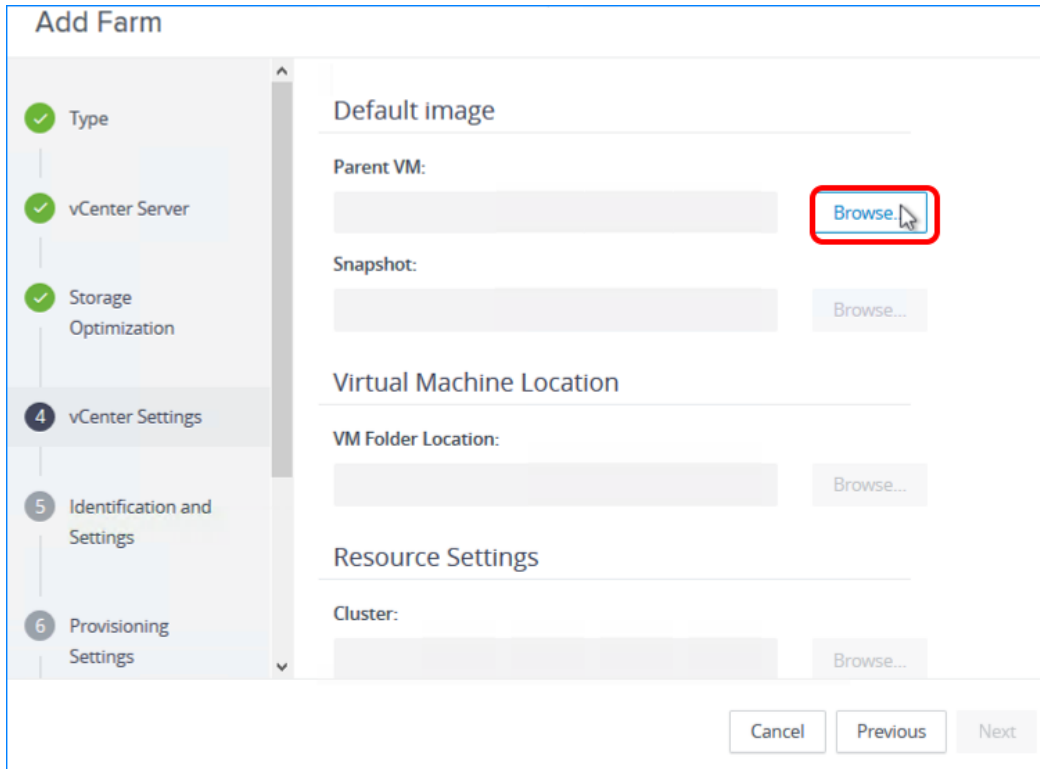

## 4. Choose Whether to Use vSAN

1. Select Do not use VMware Virtual SAN.
2. Click Next.

In a production environment, you might select to use VMware Virtual SAN. VMware Virtual SAN, or [VMware vSAN](#), is a software-defined storage tier that virtualizes the local physical storage disks available on a cluster of vSphere hosts. You specify only one datastore when creating an automated desktop pool or an automated farm, and the various components, such as virtual machine files, replicas, user data, and operating system files, are placed on the appropriate solid-state drive (SSD) disks or direct-attached hard disks (HDDs).

## 5. Complete the Default Image Settings

The screenshot shows the 'Add Farm' wizard in Horizon Console. On the left, a sidebar lists the steps: Type, vCenter Server, Storage Optimization, vCenter Settings (current step), Identification and Settings, and Provisioning Settings. The main area is titled 'Add Farm' and contains several sections: 'Default image' with 'Parent VM' and 'Snapshot' fields, 'Virtual Machine Location' with 'VM Folder Location', and 'Resource Settings' with 'Cluster'. Each field has a 'Browse...' button. The 'Browse...' button for 'Parent VM' is highlighted with a red rectangle. At the bottom, there are 'Cancel', 'Previous', and 'Next' buttons.

Click the **Browse** button next to the first setting, which is **Parent VM**.

**Important:** This page has numerous settings, and in the next steps, we do not copy this screenshot into every step, but instead only refer to it and show a screenshot of the window that appears when you click **Browse** for that setting.

**Note:** This page refers to the *default* image because after the pool is created, you can edit the pool and select a different snapshot to use if you want to push a new image and generate new desktops using that other image.

Describing all the settings in detail is beyond the scope of this quick-start guide. For details about all the settings in the Add Desktop wizard, see the product documentation topic [Worksheet for Creating an Automated Instant-Clone Farm in Horizon Console](#).

## 5.1. Select a Parent VM

Select Parent VM

Select the virtual machines to be used as the parent VM for this Automated Farm

☐ Show all parent VMs ?

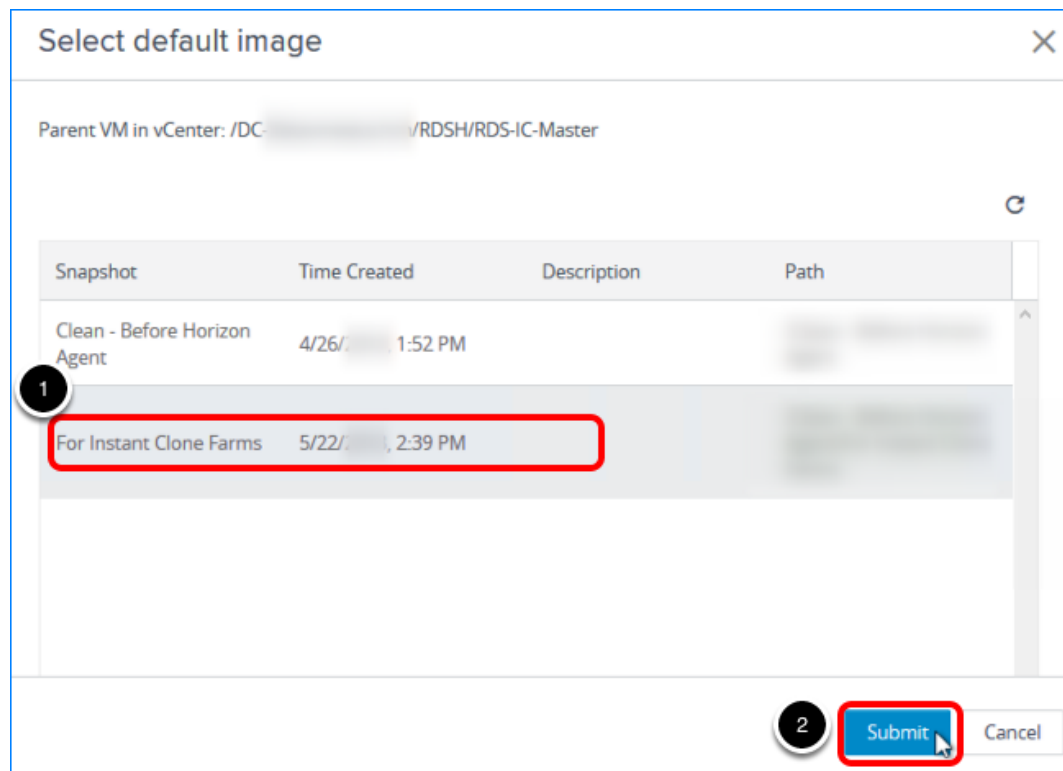

Filter

Name	Path
RDS-IC-Master	/DC-E /vm/RDSH/RDS-IC-Master
Provision_Win2016_VDI_JS	/DC- /vm/Templates /Provision_Win2016,
Win2012R2_IC_Gold_JS	/DC- /vm/Templates /Win2012R2_IC_Gold
Win2016-templ-CA	/DC- /vm/Templates/Win2016-temp

2 Submit Cancel

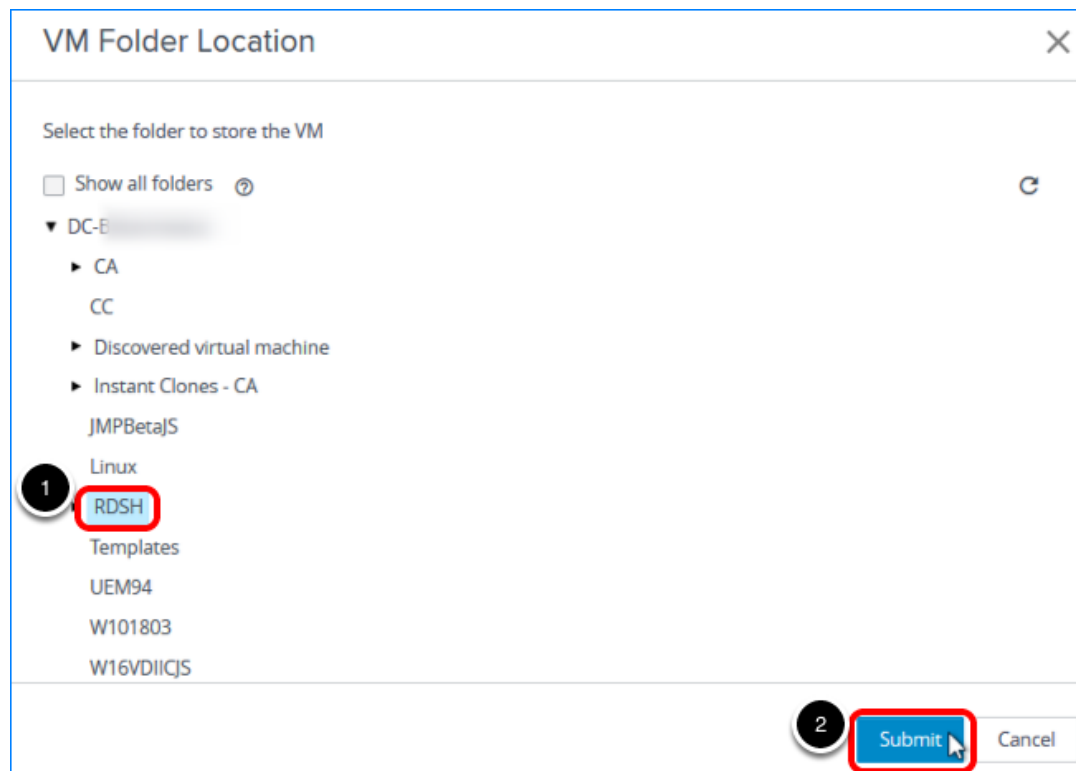

1. Select the master VM that you created.  
For instructions, see the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#).
2. Click **Submit**.

## 5.2. Select a Snapshot of the Master VM

1. Click **Browse** next to **Snapshot**, and select the snapshot to use as the default image for creating the pool.  
For instructions, see the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#).
2. Click **Submit**.

## 5.3. Select a VM Folder for the Instant Clones in the Farm

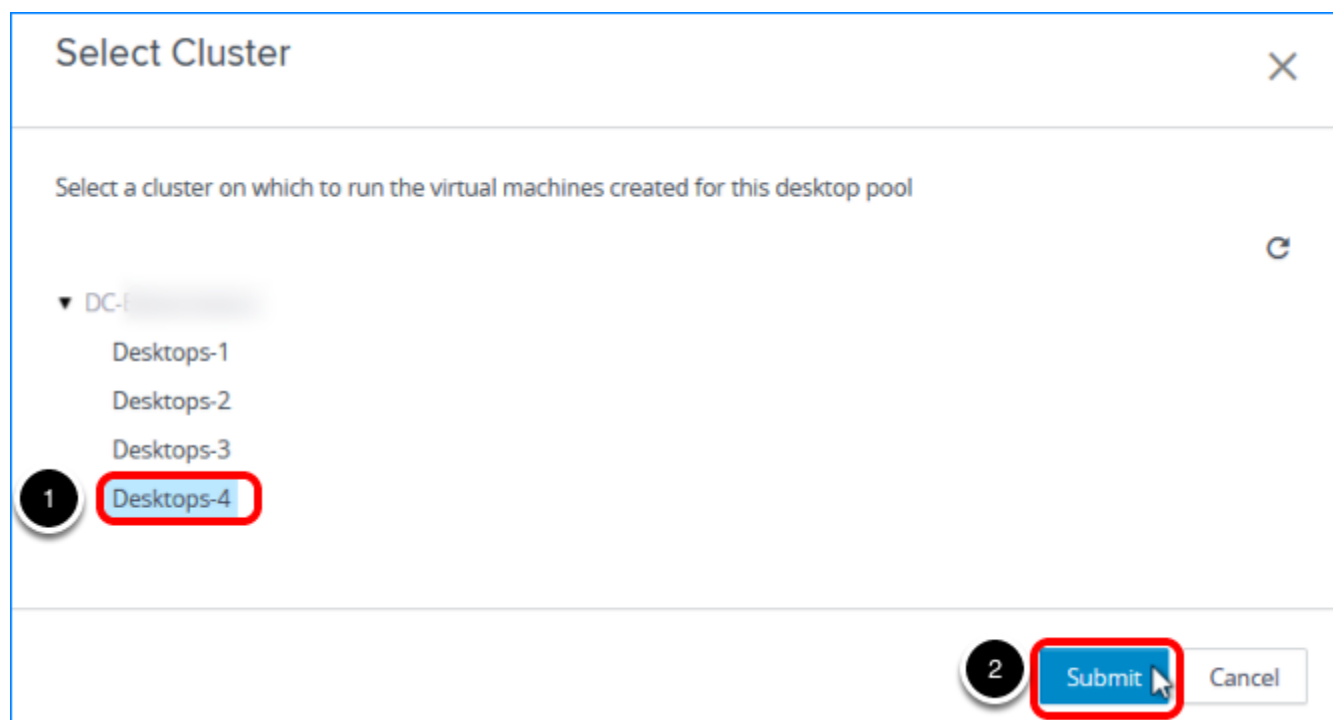

1. Click **Browse** next to **VM Folder Location**, and select the folder to use.

**Note:** The RDSH folder shown in the screenshot is just an example; you can select any available folder.

The VM folder is described in [Prerequisites for Creating an Instant-Clone Server Farm.](#)

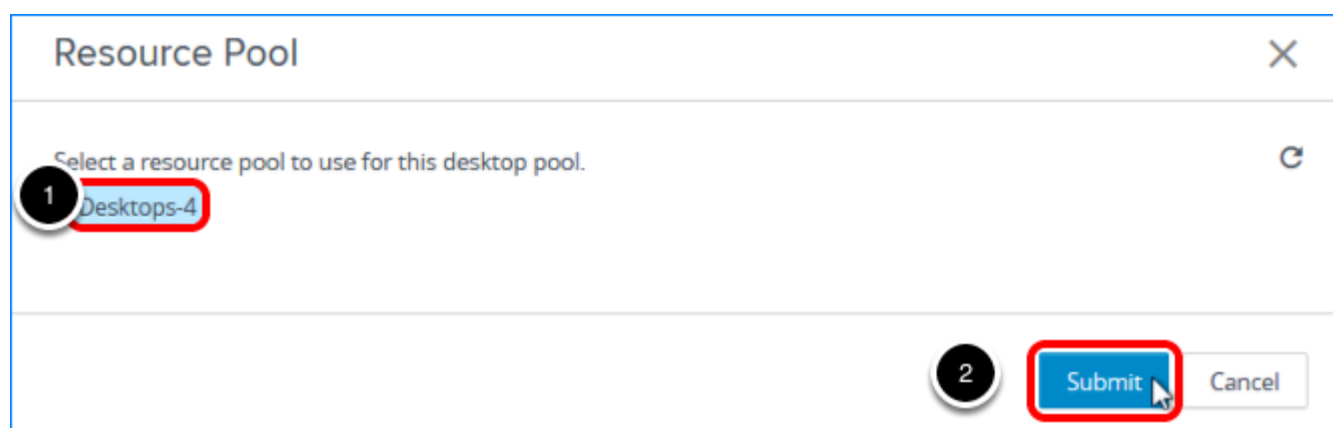

2. Click **Submit**.

## 5.4. Select the Resource Cluster

1. Click **Browse** next to **Cluster**, and select a vCenter Server resource cluster.  
**Note:** The cluster selected in the screenshot is just an example; you can select any available cluster.
2. Click **Submit**.

## 5.5. Select a Resource Pool

1. Click **Browse** next to **Resource Pool**, and select a resource pool.
2. **Note:** The resource pool selected in the screenshot is just an example; you can select any available resource pool.
3. Click **Submit**.

## 5.6. Select a Datastore for the Clones

Select the Datastore type:

Select the instant clone datastores to use for this desktop pool. Only datastores that can be used by the selected host or cluster can be selected.

☐ Show all datastores

<input type="checkbox"/>	Datastore	Capacity(GB)	Free(GB)	FS Type	Drive Type	Storage Ove...
<input type="checkbox"/>	t3600-01-Beta-VDI-4-1	2047.75 GB	1590.60 GB	VMFS6	Non-SSD	Unbounded
<input checked="" type="checkbox"/>	t3600-01-Beta-VDI-4-2	2047.75 GB	1739.44 GB	VMFS6	Non-SSD	Unbounded

2 Submit Cancel

1. Click **Browse** next to **Instant-Clone Datastores**, and select a datastore.
2. **Note:** The datastore selected in the screenshot is just an example; you can select any available datastore or multiple datastores.
3. Click **Submit**.

## 5.7. Select a Network

Select Networks

Select networks to use for this automated farm.

☒ Use network from current parent VM image

1

Select the networks to use for this instant clone farm. Only static binding port groups are supported by instant clones.

Filter

Network	Port Binding	Total Ports	Available Ports
DPG-ESXi_Mgmt	earlyBinding	64	54
DPG-iSCSI1	earlyBinding	64	54
DPG-iSCSI2	earlyBinding	64	54
DPG-vMotion	earlyBinding	64	54

2

Submit

Cancel

1. Click **Browse** next to **Network**, and note that by default you use the same network as the master image VM.
2. Click **Submit**.

## 5.8. Click Next on the Default Image Page

The screenshot shows the 'Add Pool' wizard in VMware Horizon. The left sidebar contains a list of steps: Type, vCenter Server, User Assignment, Storage Optimization, vCenter Settings (highlighted with a '5'), and Desktop Pool Identification (highlighted with a '6'). The main area is titled 'Resource Settings' and contains the following fields:

- Cluster: /DC-E /vm/Instant Clones - CA (Browse...)
- Resource pool: /DC-E /host/Desktops-4/Resources (Browse...)
- Instant clone datastores: 1 selected (Browse...)
- Replica disk datastores: 1 selected (Browse...)
- Network: Parent VM network selected (Browse...)

At the bottom right, there are three buttons: 'Cancel', 'Previous', and 'Next'. The 'Next' button is highlighted with a red box.

The screenshot shows the 'Add Farm' wizard in VMware Horizon. The left sidebar contains a list of steps: Type, vCenter Server, Storage Optimization, vCenter Settings (highlighted with a '4'), Identification and Settings (highlighted with a '5'), and Provisioning Settings (highlighted with a '6'). The main area is titled 'Virtual Machine Location' and contains the following fields:

- VM Folder Location: /DC-E /vm/RDSH (Browse...)
- Cluster: /DC-E /host/Desktops-4 (Browse...)
- Resource pool: /DC-E /host/Desktops-4/Resources (Browse...)
- Datastores: 1 selected (Browse...)
- Network: Parent VM network selected (Browse...)

At the bottom right, there are three buttons: 'Cancel', 'Previous', and 'Next'. The 'Next' button is highlighted with a red box.

On the page that summarizes the default image settings you selected, click Next.

## 6. Enter a Pool ID and Select Remote Display Settings

The screenshot shows the 'Add Farm - RDSH-farm' wizard. The left sidebar has a progress bar with steps: 1. ID, 2. HTML Access, 3. Allow Session Collaboration, and 4. Next. The main area shows settings for the farm. Step 1: 'ID' field contains 'RDSH-farm'. Step 2: 'HTML Access' is checked and 'Enabled'. Step 3: 'Allow Session Collaboration' is checked and 'Enabled'. Step 4: 'Next' button is highlighted.

1. Add a pool ID; for example, enter `RDSH-Farm`.
2. Scroll down and select the **HTML Access** check box so that users will be able to access virtual desktops using their web browsers in addition to Horizon Client.
3. Select **Allow Session Collaboration**.
4. Use the defaults for the other settings, and click **Next**.

## 7. Specify Provisioning Settings

**Add Farm - RDSH-Farm**

**Basic**

- ☒ Enable provisioning
- ☒ Stop provisioning on error

**Virtual Machine Naming**

\* Naming Pattern:

1

**Farm Sizing**

\* Max number of machines:

2

\* Minimum number of ready (provisioned) machines during Instant Clone maintenance operations:

3

4

1. Enter a naming pattern for the VMs. For example, for this exercise, you can use `RDSH-`. This naming pattern helps you identify RDSH server instant clones in Horizon Console.
2. For farm sizing, set **Max number of machines** to 10 or fewer (for the purposes of this exercise).  
In a production environment, instant-clone farms have been tested to support up to 200 servers.
3. Set **Number of ready machines** to 1.
4. Use the defaults for the other settings, and click **Next**.

## 8. Select a Domain Administrator and an OU

**Add Farm - RDSH-Farm**

Storage Optimization ✓

Pre-launch session timeout (applications only)	10 minutes
Empty session timeout (applications only)	1 minute
When timeout occurs	Disconnect

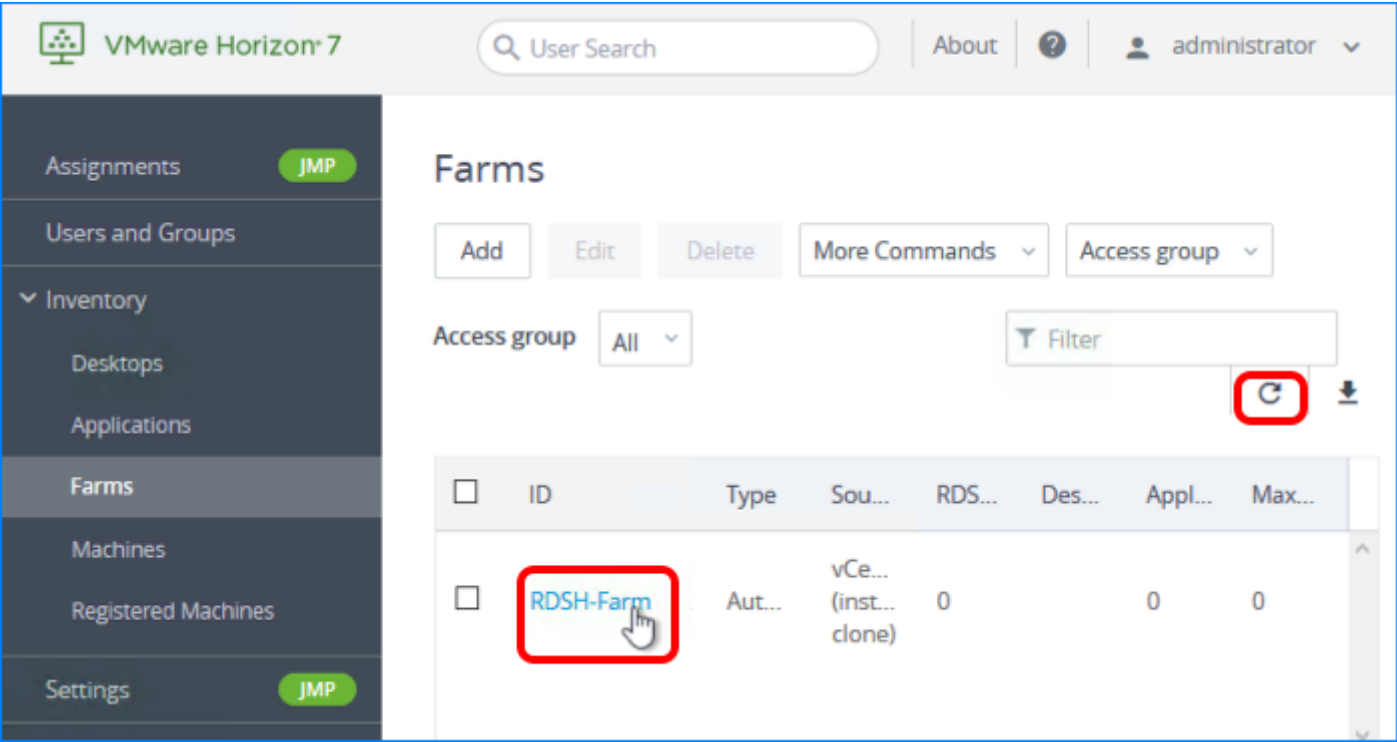

Cancel Previous **Submit**

Leave the check box at the top of the window de-selected, and click **Submit**. Entitling users is a separate exercise.

For more information about the available settings in this wizard, see the product documentation topic [Worksheet for Creating an Automated Instant-Clone Farm in Horizon Console](#).

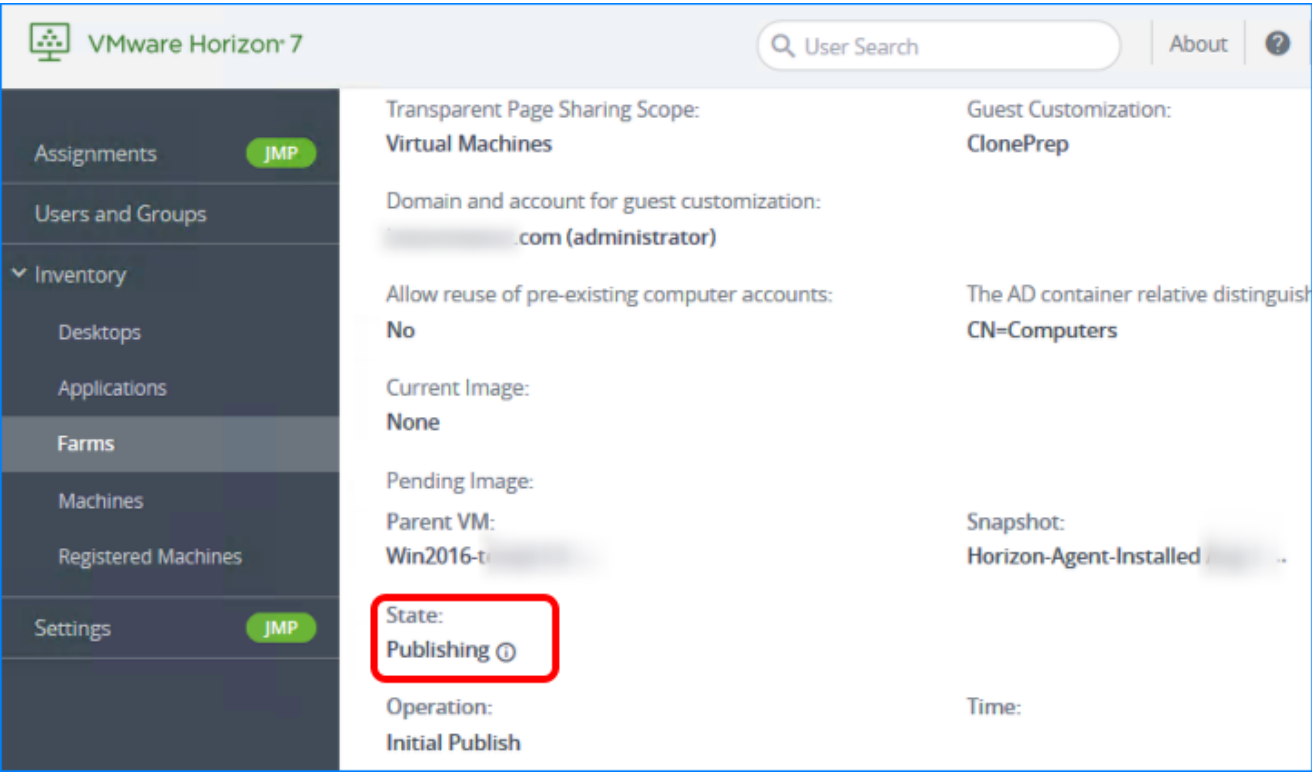

You are returned to the Farms list, where you can verify that the newly created farm was added to the list.

# 10. Monitor the Farm Creation Process

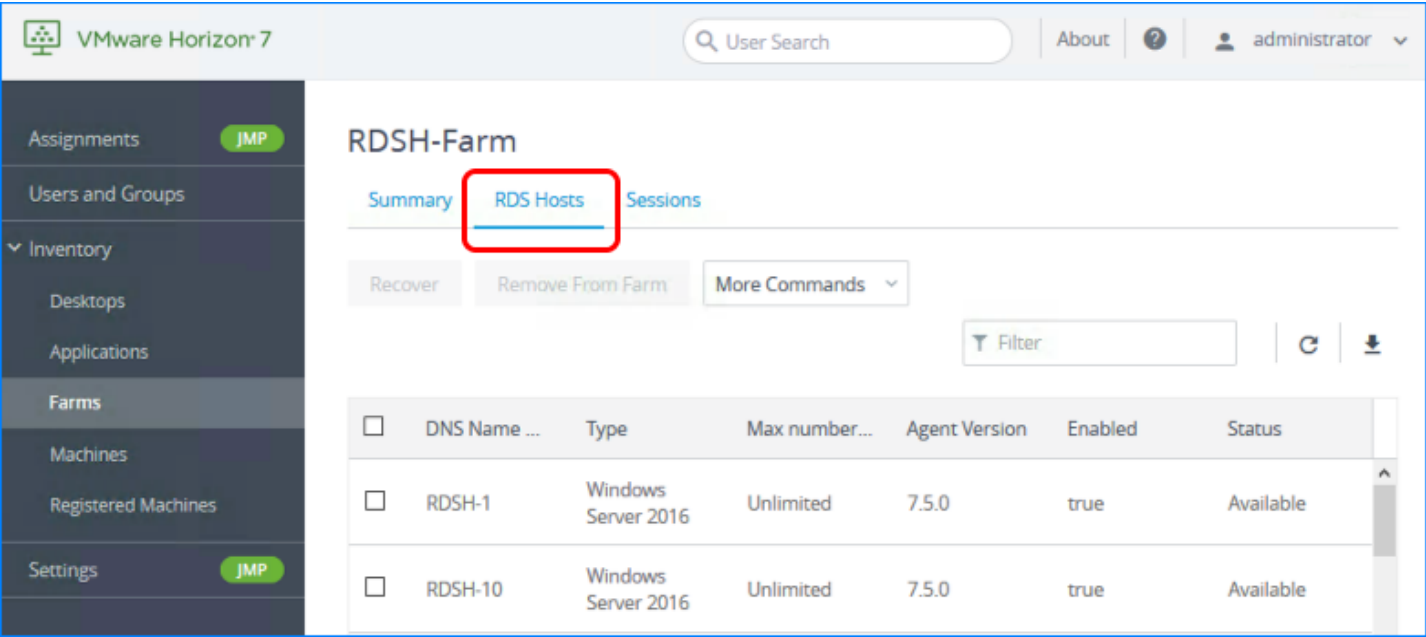

To access details about the newly added pool, click the farm name on the Farms page. If you do not see the farm listed, click the Refresh icon above the table.

# 11. Check the Publish State

On the Summary tab, scroll down to the State area. The status changes from Publishing to Published.

# 12. Check the List of Hosts

After the status changes to **Published**, scroll up and click the RDS Hosts tab to verify that the 10 RDSH servers were created.

# Deploy an RDSH-Published Desktop Pool

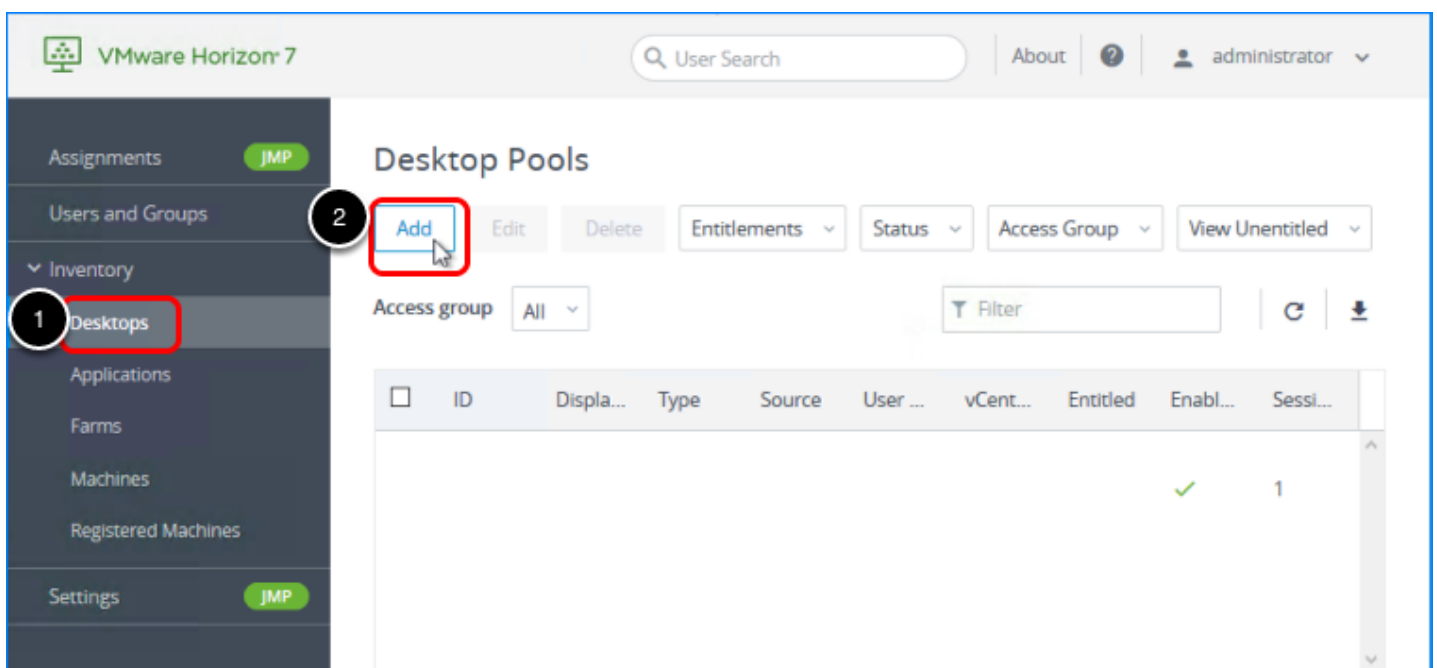

An RDSH desktop pool has different characteristics than an instant-clone, full-clone, or linked-clone automated desktop pool. An RDSH desktop pool is based on a session to an RDSH server. Now that you have created an RDSH server farm, you can select that farm when creating your desktop pool. For this exercise, you will use the newest Horizon 7 management interface, the Horizon Console.

**Important:** If your session in the Horizon Console is idle for more than a few minutes, you might be automatically logged out, and if you were in the middle of creating a desktop pool, your changes are lost.

## Prerequisite for Deploying a Session-Based Desktop Pool

To perform this exercise, you need to have completed the exercise [Create an Instant-Clone RDSH Server Farm](#). Although it is possible to actually create the RDSH server farm as part of using the Add Desktop Pool wizard, the steps in this exercise direct you to select an existing server farm.

### 1. Start the Add Pool Wizard in the Horizon Console

1. Log in to the Horizon Console, and select Inventory > Desktops.  
The format of the URL for accessing the console is:  
`https://<connection-server-FQDN>/newadmin`
2. Click Add.

## 2. Select the RDS Desktop Pool Type

The screenshot shows the 'Add Pool' wizard in VMware Horizon 7. The wizard has five steps: 1. Type, 2. Desktop Pool Identification, 3. Desktop Pool Settings, 4. Select RDS Farms, and 5. Ready to Complete. In the 'Type' step, there are two radio button options: 'Automated desktop pool' and 'RDS desktop pool'. The 'RDS desktop pool' option is selected and highlighted with a red rectangle and a circled '1'. At the bottom right, there are three buttons: 'Cancel', 'Previous', and 'Next'. The 'Next' button is highlighted with a red rectangle and a circled '2'.

1. Select RDS Desktop Pool.
2. Click Next.

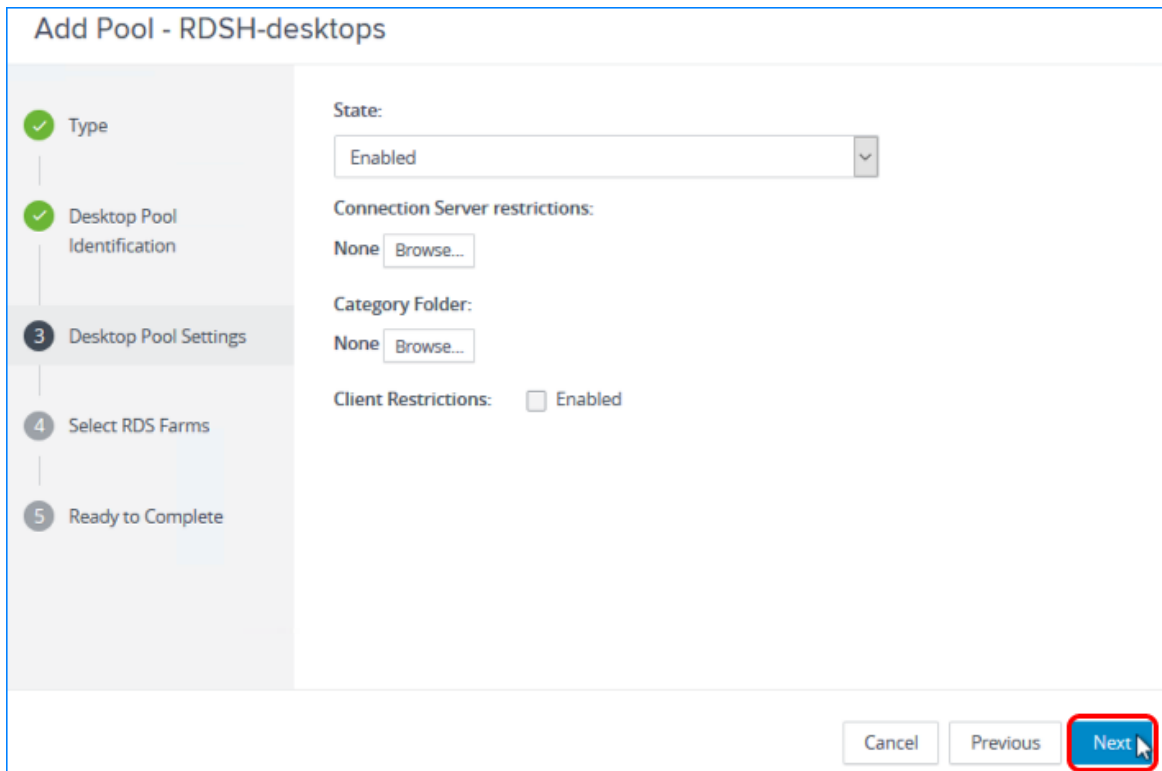

### 3. Complete the Desktop Pool Identification Page

The screenshot shows a wizard titled "Add Pool - RDSH-desktops" with five steps in a sidebar: 1. Type (completed), 2. Desktop Pool Identification (current step), 3. Desktop Pool Settings, 4. Select RDS Farms, and 5. Ready to Complete. The main area contains three input fields: "ID:" with the value "RDSH-desktops", "Display name:" with the value "RDSH Desktop", and an empty "Description:" field. At the bottom right, there are "Cancel", "Previous", and "Next" buttons. Red boxes and numbers 1, 2, and 3 highlight the ID field, the Display name field, and the Next button, respectively.

1. Add a pool ID; for example, `RDSH-desktops`.
2. (Optional) Add a display name, such as `RDSH Desktop`, which users will see when they log in using Horizon Client or the HTML Access web client.  
If you do not provide a display name, the pool ID is used for the display name.
3. Click **Next**.

## 4. Click Next on the Desktop Pool Settings Page

The screenshot shows the 'Add Pool - RDSH-desktops' wizard. On the left is a vertical progress bar with five steps: 1. Type (checked), 2. Desktop Pool Identification (checked), 3. Desktop Pool Settings (current step, highlighted), 4. Select RDS Farms, and 5. Ready to Complete. The main area contains settings for the desktop pool. The 'State' dropdown is set to 'Enabled'. Under 'Connection Server restrictions', the 'None' option is selected with a 'Browse...' button. Under 'Category Folder', the 'None' option is selected with a 'Browse...' button. Under 'Client Restrictions', the 'Enabled' checkbox is unchecked. At the bottom right, there are three buttons: 'Cancel', 'Previous', and 'Next'. The 'Next' button is highlighted with a red rectangle and a mouse cursor is pointing at it.

Add Pool - RDSH-desktops

Click **Next** to accept the default settings. For more information about the settings, see the product documentation topic [Desktop Pool Settings for RDS Desktop Pools](#).

## 5. Select the RDS Farm You Created

**Add Pool - RDSH-desktops**

1 ☐ Create a new RDS farm  
2 ☒ Select an RDS farm for this desktop pool

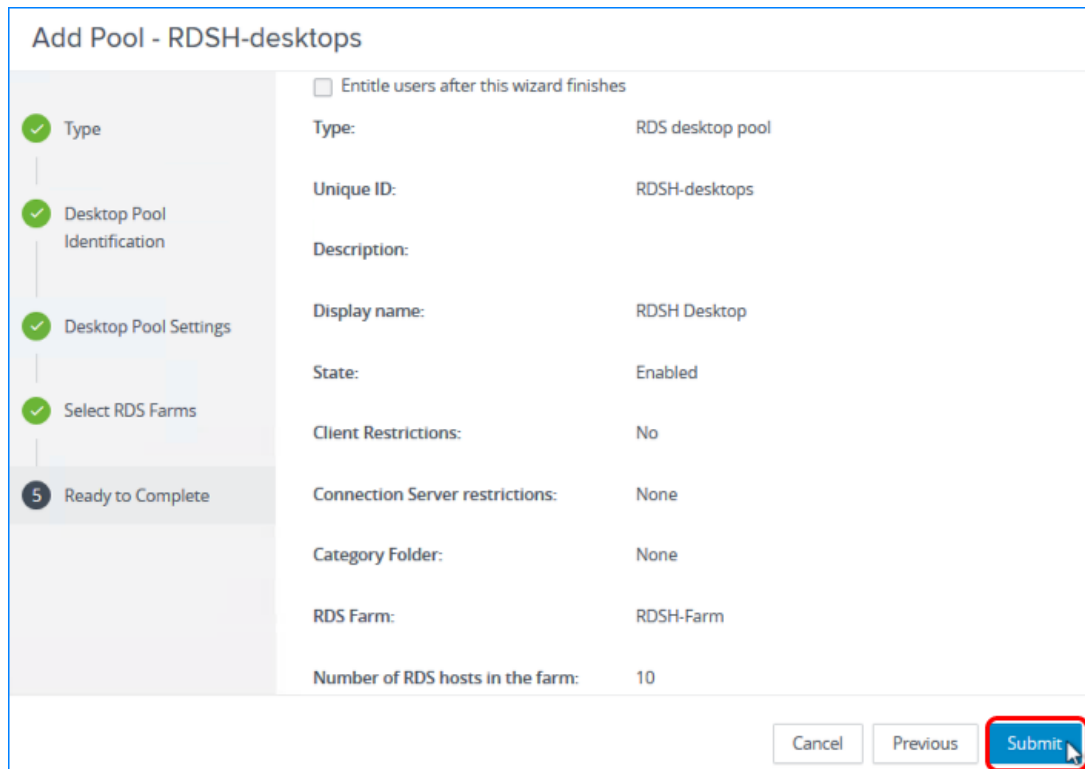

ID	Description	RDS Hosts	Max number ...	Status
RDSH-Farm		10	Unlimited	No problem detected

3 Cancel Previous **Next**

1. Click **Select an RDS farm for this desktop pool**.
2. Select the farm name in the list. This is the farm that you created in the exercise [Create an Instant-Clone RDSH Server Farm](#).
3. Click **Next**.

**Note:** As an alternative to creating the RDSH server farm before you complete this Add Desktop Pool wizard, you can select **Create a new RDS farm**. If you use this option, additional pages are added to this wizard, and you are prompted to specify farm settings and select the RDSH server or servers to add to the farm.

## 6. Begin Deploying the Desktop Pool

**Add Pool - RDSH-desktops**

☐ Entitle users after this wizard finishes

Type: RDS desktop pool

Unique ID: RDSH-desktops

Description:

Display name: RDSH Desktop

State: Enabled

Client Restrictions: No

Connection Server restrictions: None

Category Folder: None

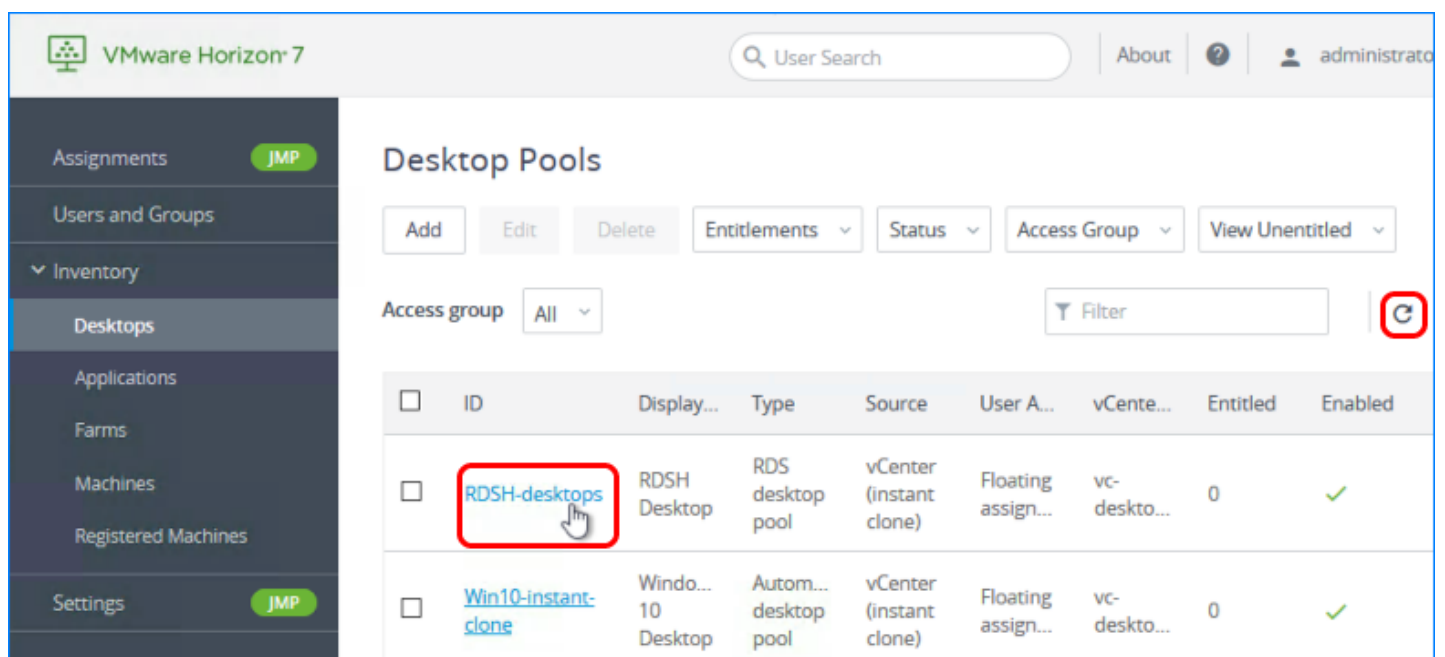

RDS Farm: RDSH-Farm

Number of RDS hosts in the farm: 10

Buttons: Cancel, Previous, **Submit**

Leave the check box at the top of the window de-selected, and click **Submit**. Entitling users is a separate exercise.

To access details about the newly added pool, click the pool name on the Desktop Pools page. If you do not see the pool listed, click the Refresh icon above the table.

## 8. Review Pool Details

Review the pool information. In addition to the information shown in the screenshot, if you scroll down, you see information about the server farm used for this pool.

# Publish Applications Hosted on RDSH Servers

The Published Applications feature supports a wealth of remote-experience features, which include client-drive redirection, access to locally connected USB devices, file-type association, Windows media redirection, content redirection, printer redirection, location-based printing, 3D rendering, smart card authentication, and more.

After applications are published, end users launch Horizon Client, or the HTML Access web client, to access a catalog of published applications. Selecting an application from the catalog opens a window for that application on the local client device, and the application looks and behaves as if it were locally installed.

For example, on a Windows client computer, an item for the application appears in the taskbar and looks identical to the way it would look if it were installed on the local Windows computer. Users can also create shortcuts for published applications, and the shortcuts appear on the client desktop, just like shortcuts for locally installed applications.

To publish applications, administrators create an application pool. Horizon 7 automatically enumerates the installed applications on the RDSH servers. Administrators can select which of the applications to deploy and entitle users to.

For this exercise, you will use the newest Horizon 7 management interface, the Horizon Console.

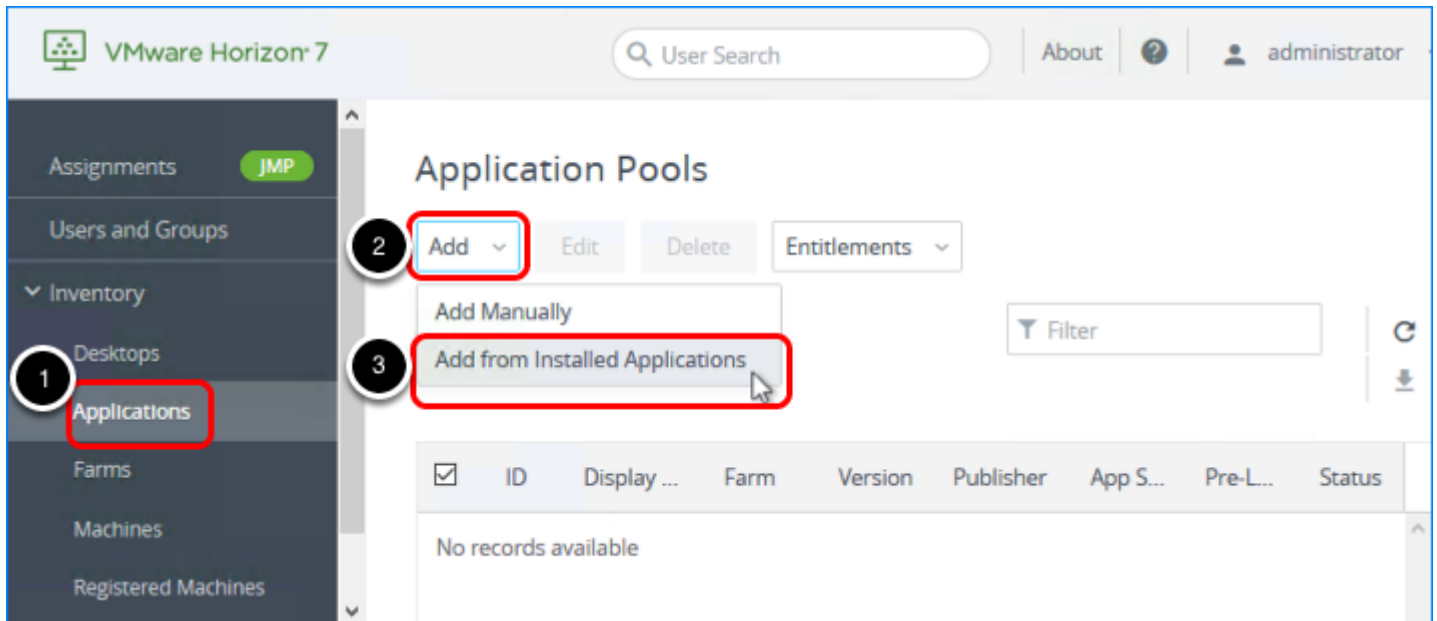

**Important:** If your session in the Horizon Console is idle for more than a few minutes, you might be automatically logged out, and if you were in the middle of creating an application pool, your changes are lost.

## Prerequisites for Publishing Applications

- **RDSH server farm** – You need to have completed the exercise [Create an Instant-Clone RDSH Server Farm](#). Although it is possible to actually create the RDSH server farm as part of using the Add Desktop Pool wizard, the steps in this exercise direct you to select an existing server farm.
- **Applications** – The applications you provide to end users can be either installed directly on the RDSH server, or dynamically attached, as App Volumes AppStacks. Before you begin this exercise, install any applications that you want to have in the base image, available for all users.

**Note:** To install applications directly on an RDSH server, place the host into RD-Install mode, install the desired applications, and place the host back into RD-Execute mode. For more information, see the Microsoft TechNet article [Learn How To Install Applications on an RD Session Host Server](#). If you plan to use AppStacks, be sure to install the App Volumes Agent, as described in the guide [Creating an Optimized Windows Image for a VMware Horizon Virtual Desktop](#).

# 1. Start the Add Pool Wizard in the Horizon Console

1. Log in to the Horizon Console, and select **Inventory > Applications**.

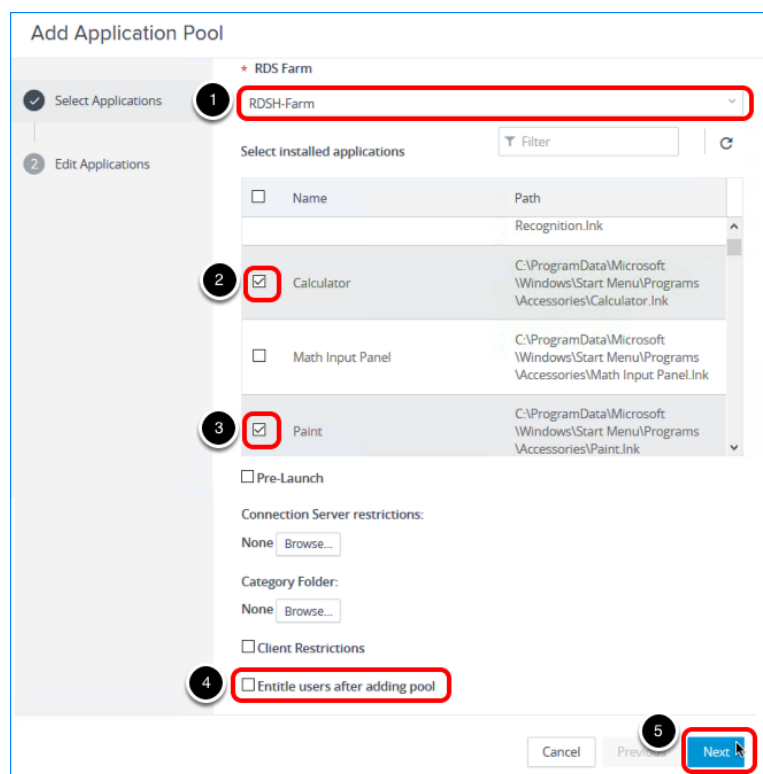

The format of the URL for accessing the console is:

```
https://<connection-server-FQDN>/newadmin
```

2. Click **Add**.
3. Select **Add from Installed Applications**.

**Note:** For this exercise, you will use installed applications. For information about adding an application pool manually, see the product documentation topic [Worksheet for Creating an Application Pool Manually](#).

## 2. Select Applications

1. Select the automated server farm you created.
2. Click the check box next to an application.  
**Note:** The list of applications includes both natively installed apps and App Volumes AppStacks that you have attached to the servers, if you are using AppStacks.
3. Click the check box next to another application. You can create multiple application pools with only one trip through the wizard.
4. De-select the check box **Entitle users after adding the pool**. You will entitle users in a later exercise.
5. For the other settings, use the defaults, and click **Next**.

For information about the other settings on this page, including Pre-launch, category folder, and restrictions, see the product documentation topic [Worksheet for Creating an Application Pool Manually](#).

### 3. Edit the Display Name and Begin Pool Deployment

✓ Select Applications

2 Edit Applications

Edit ID and Display Name of selected applications

ID	Display name	Path
Calculator	RDSH-Calculator	C:\ProgramData\Microsoft\Windows\Start Menu\Programs\Accessories\Calculator.Ink
Paint	RDSH-Paint	C:\ProgramData\Microsoft\Windows\Start Menu\Programs\Accessories\Paint.Ink

Cancel Previous Submit

1. Add **RDSH-** to the beginning of the display name. This way, if you later open the published app on a Windows computer, you will be able to distinguish between the locally installed app and the RDSH-published app.
2. Click B.

The wizard closes and the application pools are added to the list.

# Perform Maintenance on a Server Farm

When you use automated instant-clone RDSH server farms, you can rapidly change the size of the farm, refresh the servers back to their original state and disk size, or update the servers to use a new master image. Performing maintenance on an instant-clone farm means deleting the VMs in the farm and either recreating them from the current master image or creating VMs from a new master image, or snapshot.

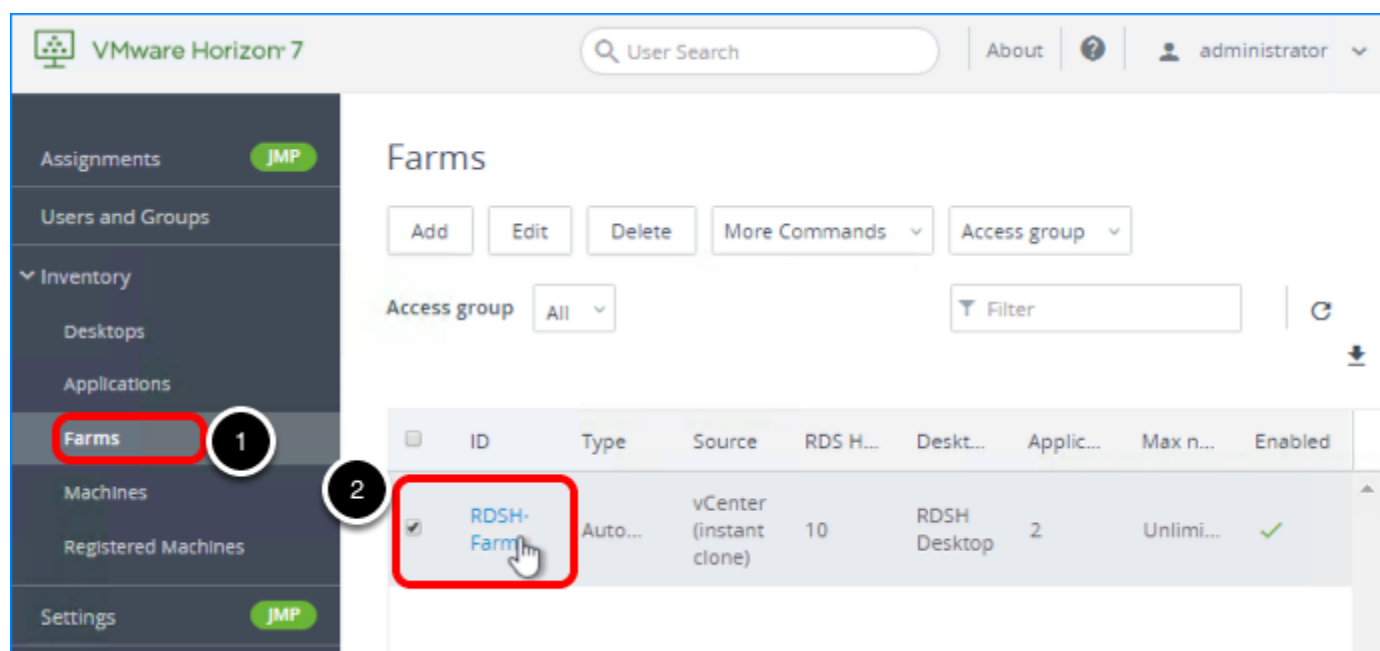

- Create a recurring maintenance schedule to restore the operating system disk of each VM in the farm to its original state and size, reducing storage costs. The VM is deleted and recreated from the currently selected master image.
- Schedule immediate maintenance to change the master image used by the VMs in the farm, such as to apply an urgent security patch.

You can use both types of schedules at the same time, and if you specified a minimum number of provisioned servers to be available during maintenance operations, your end users might never have their work interrupted.

## Prerequisites for Performing This Exercise

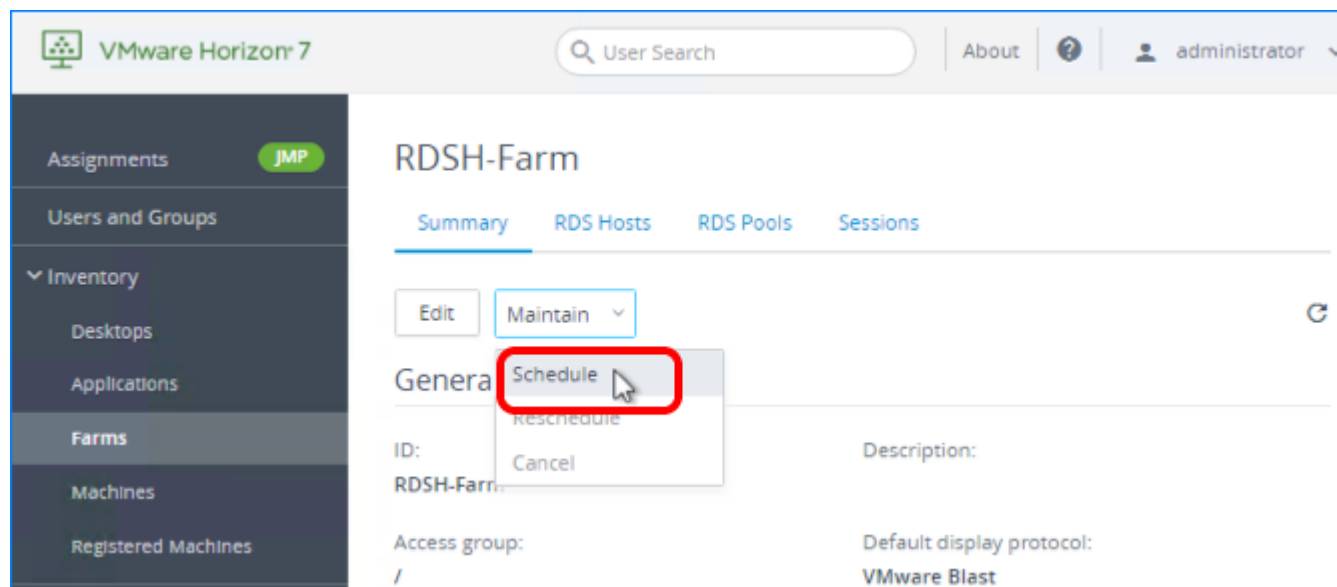

This exercise involves making changes to instant-clone RDSH server farms. Therefore, you must have completed the exercise [Create an Instant-Clone RDSH Server Farm](#) before you begin this exercise.

### 1. Click the Farm Name

1. Log in to the Horizon Console, and select **Inventory > Farms**.  
The format of the URL for accessing the console is: <https://<connection-server-FQDN>/newadmin>
2. Click the farm name; for this example the farm name is RDSH-Farm.

## 2. Select to Schedule Maintenance

On the **Summary** tab, select **Schedule** from the **Maintain** drop-down list.

### 3. Set a Weekly Maintenance Schedule

**Schedule Recurring Maintenance**

**1** Maintenance

**2** Image

**3** Schedule Maintenance Setting

**4** Ready to Complete

**Maintenance Mode**

**Schedule**

Recurring

Immediate

Recurring maintenance will refresh the image of all the RDS servers in a farm. During each maintenance cycle all RDS servers will be refreshed from the parent image.

**Effective From:** 08-10 10 : 07 Web browser local time

**Recurring Maintenance Configuration**

**Maintenance Period:** ☐ Daily ☒ Weekly ☐ Monthly

**Day of the Week:** Sunday

**Repeat Interval:** Every 1 week(s)

**3** Next Cancel

1. For **Schedule**, select **Recurring**.

**Note:** If, instead, you select **Immediate** from the drop-down list, you are prompted to specify the task start time.

2. For **Maintenance Period**, select **Weekly**.

3. Click **Next**.

## 4. Click Next to Use the Current Snapshot

The screenshot shows the 'Schedule Recurring Maintenance' wizard with four steps: 1. Maintenance (completed), 2. Image (current step), 3. Schedule Maintenance Setting, and 4. Ready to Complete. In the 'Image' step, the 'Use current parent VM image' checkbox is checked and highlighted with a red box. Below this, the 'Parent VM in vCenter' is set to '/DC-1/vm/Templates/Win2016-templ-CA' with a 'Change...' button. A 'Snapshot' section shows a table with columns 'Snapshot', 'Time Created', 'Description', and 'Path', but it contains the text 'No records available'. At the bottom right, the 'Next' button is highlighted with a red box, while 'Back' and 'Cancel' are dimmed.

**Schedule Recurring Maintenance**

**Image**

The snapshot of the current parent VM will usually be used for maintenance. If required, select a different VM or snapshot to use for maintenance.

The machines created in this Automated Farm will use the information in the snapshot image as their baseline system configuration.

☒ Use current parent VM image

Parent VM in vCenter:

/DC-1/vm/Templates/Win2016-templ-CA [Change...](#)

Snapshot:

[Snapshot Details](#)

Snapshot	Time Created	Description	Path
No records available			

[Back](#) [Next](#) [Cancel](#)

On the Image page, click **Next**. (If the **Next** button is dimmed, de-select **Use current parent VM image** and then select the check box again.)

The default is to use the current master image. To select a different master VM and snapshot, you can de-select the check box, browse to a new master VM, and select one of its snapshots.

**Note:** Setting this schedule so that it runs weekly means that on a weekly basis, the servers are refreshed back to their original state and disk size using the master VM and snapshot that you specify.

## 5. Click Next to Start the Task After Users Log Off

**Schedule Recurring Maintenance**

Maintenance  
Image  
3 Schedule Maintenance Setting  
4 Ready to Complete

**Schedule Maintenance Setting**

Specify when you want this task to start

☒ Wait for users to log off  
Wait for connected users to disconnect before the task starts. The task starts immediately on machines without active sessions.

☐ Force users to log off  
Users will be forced to log off when the system is ready to operate on their virtual machines. Before being forcibly logged off, users may have a grace period in which to save their work (Global Settings).

☒ Stop at first error ⓘ

The warning and grace period can be edited in global settings:

☒ Display warning before forced logoff:

Log off time:  
5 minutes

Log off message:  
Your desktop is scheduled for an important update and will shut down in 5 minutes. Please save any unsaved work now

Back Next Cancel

Click **Next**.

The default is **Wait for users to log off**. If, instead, you select to force users to log off, you can give users a warning and a grace period of 5 minutes, by default. To edit this setting, after you finish creating the schedule, open the Horizon Administrator (<https://<connection-server-FQDN>/admin>), navigate to **View Configuration > Global Settings**, and click **Edit** in the General settings section.

## 6. Click Finish to Complete the Maintenance Schedule

**Schedule Recurring Maintenance**

Ready to Complete

Review the options and click Finish

Forced logoff global settings:

Log off message: Your desktop is scheduled for an important update and will shut down in 5 minutes. Please save any unsaved work now

Log off time: 5 minutes

Affected virtual machines: 10

Effective From: 8/10/2016 10:07 AM

Maintenance Period: Weekly, Every 1 week(s)

Day of the Week: Sunday

User log off: Wait for users to log off

Stop at first error: Yes

Parent VM in vCenter: /DC-1/vm/Templates/Win2016-

Image: /Horizon-Agent-Installed

Back **Finish** Cancel

Click Finish. You are returned to the Summary tab for the farm.

The schedule you set appears in the Farm Maintenance section.

**VMware Horizon 7**

User Search About ? admin

Applications

**Farms**

Machines

Registered Machines

Settings JMP

**Farm Maintenance**

Next Maintenance Time: Sun Aug 12 15:04:00 GMT-0700 (Pacific Daylight Time)

Immediate Maintenance Scheduled: No

Recurring Maintenance Configuration:-

Recurring Period: Weekly, Every 1 week(s)

Day of the Week: Sunday

vCenter Server

VM folder: RDSH-Farm

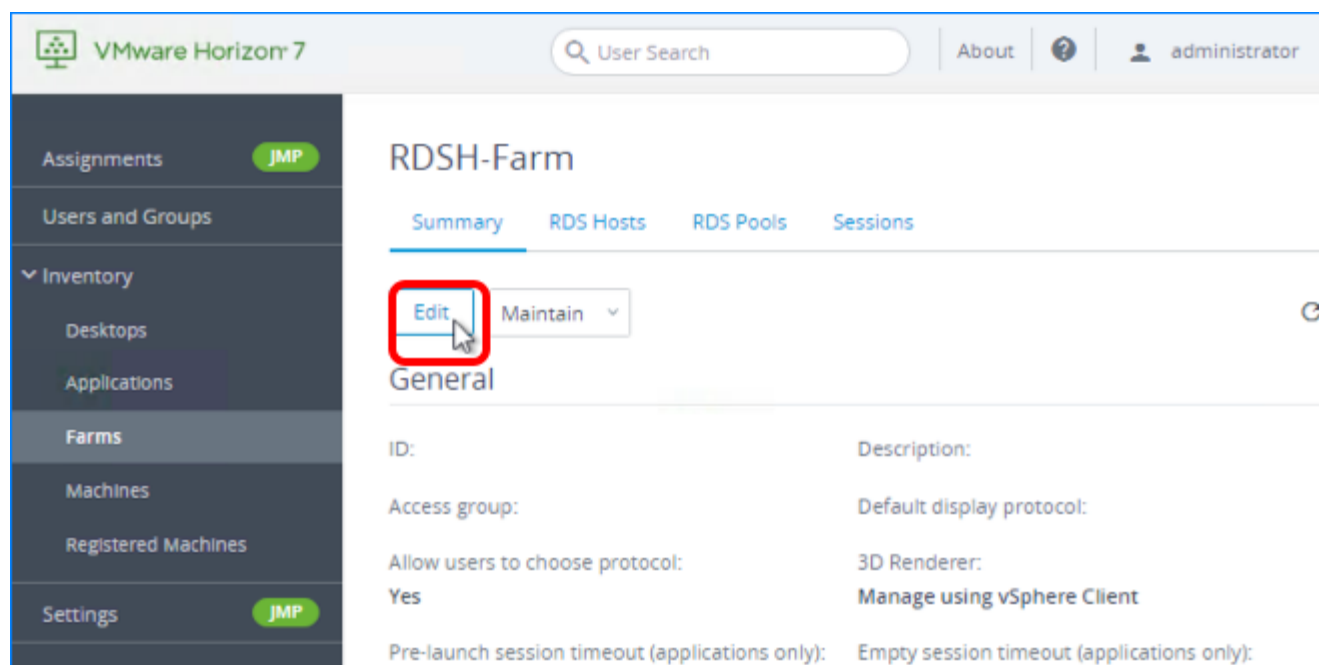

Cluster: Desktops-3

If, in addition to this recurring schedule, you find you need to schedule an immediate push of a new master image, you can repeat this process, selecting **Maintenance > Immediate** rather than

Recurring. The farm would then have both a recurring and an immediate maintenance schedule.

In the following steps, we will explore other maintenance tasks.

## 7. Select to Edit the Farm

Scroll back up to the top of the page, and click **Edit**.

## 8. Change the Max Number of Machines to 4

Edits Farm - undefined

Farm Settings **1** Provisioning Settings vCenter Settings Guest Customization

Basic

- ☒ Enable provisioning
- ☒ Stop provisioning on error

Virtual Machine Naming

- \* Naming Pattern: RDSH

Farm Sizing

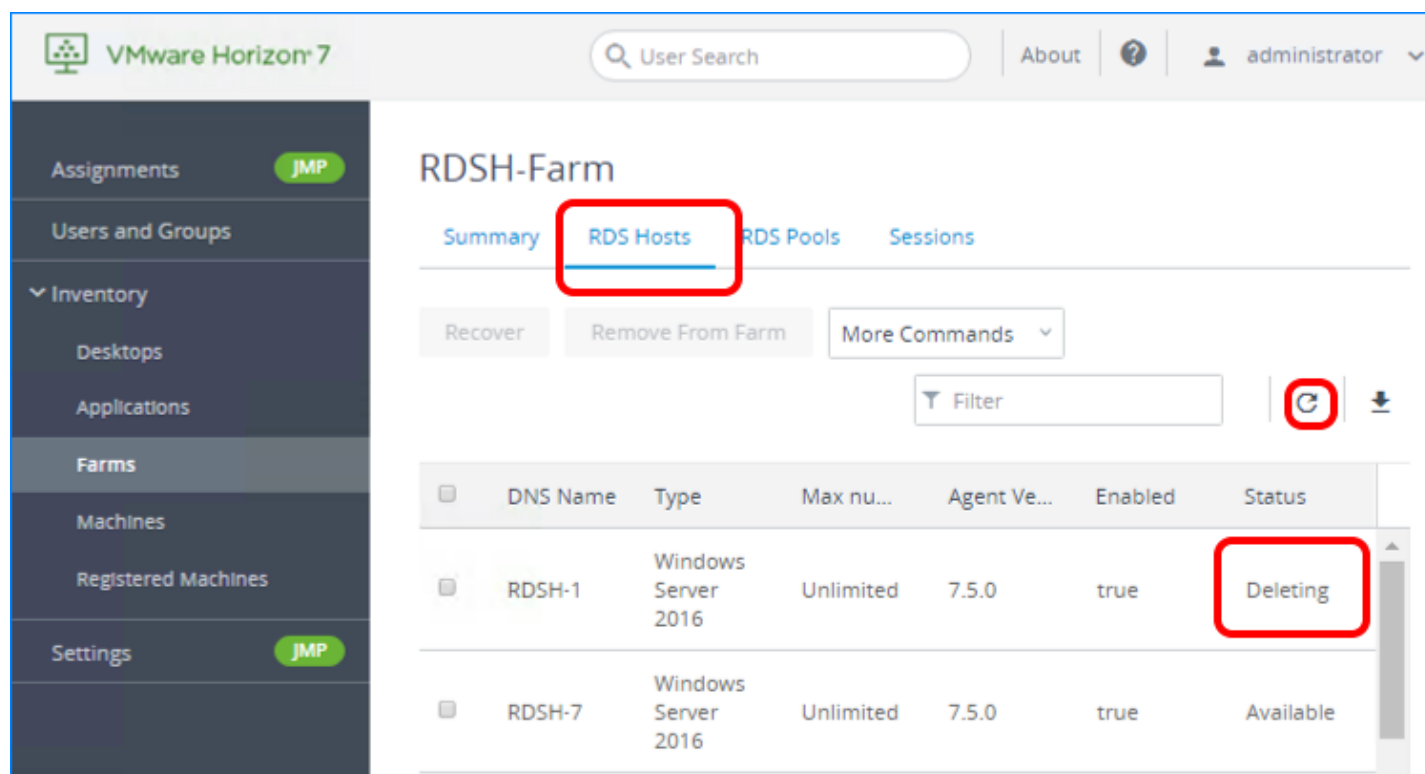

- \* Max number of machines: **4** **2**
- \* Minimum number of ready (provisioned) machines during Instant Clone maintenance operations: 0

Cancel **3** OK

1. Click the **Provisioning Settings** tab.
2. In the **Farm Sizing** section, set the **Max number of machines** to **4**.
3. Click **OK**.

You are returned to the **Farms Summary** tab.

## 9. Monitor Changing the Size of the Farm

	DNS Name	Type	Max nu...	Agent Ve...	Enabled	Status
<input type="checkbox"/>	RDSH-1	Windows Server 2016	Unlimited	7.5.0	true	Deleting
<input type="checkbox"/>	RDSH-7	Windows Server 2016	Unlimited	7.5.0	true	Available

Click the RDSH Hosts tab. Note that the status for some of the servers changes to **Deleting**. Some servers are deleted to reduce the size of the farm to 4 machines.

Click the **Refresh** icon, if necessary, to update the status.

**Tip:** If you change the maximum number of machines to a larger number, the new RDSH servers will typically become available within a minute. This is because the VM snapshot is already published, and therefore only the instant-clone provisioning phase is required.

# Provisioning Users and Accessing Virtual Desktops

# Introduction to User Provisioning

The first part of this chapter walks you through the process of entitling end users to a desktop or application pool. The second part of this chapter shows you how to connect to a virtual desktop or published application as an end user would, from a variety of client devices.

## User Entitlement

You can entitle users to an application pool or desktop pool when you create the pool. At the end of the Add Application Pool wizard or Add Desktop Pool wizard, you can select the **Entitle users after this wizard finishes** check box.

You can also create user entitlements after the pool is created. If you are entitling users to application pools, you can select multiple application pools, and entitle users to all the selected pools. For desktop pools, you must select one pool at a time.

It is also possible to set up the system so that end users can access RDSH application pools without having to authenticate at all.

**Note:** For this evaluation, you create local entitlements, which entitle users to desktops within one Horizon 7 pod. A pod is a group of interconnected Connection Servers running in the same LAN segment that broker desktops or published applications. For information about using the Cloud Pod Architecture feature to create global entitlements, which entitle users to multiple desktops across multiple pods in a pod federation, see the guide [Administering Cloud Pod Architecture in Horizon 7](#).

**Important:** Alternatively, for instant-clone desktop pools, you can also entitle users by using the JMP Integrated Workflow to define a JMP assignment. JMP assignments include information about the App Volumes AppStacks, instant-clone desktops pools, and User Environment Manager settings for specific groups of users. For instructions, see the [Quick-Start Tutorial for VMware Horizon JMP Integrated Workflow](#).

## Launching Remote Desktops and Applications from Client Devices

After you have finished deploying virtual desktops or published applications and entitling users, you are ready to explore end-user connection options. End users can connect to desktops and applications using different Horizon Clients, including desktop and mobile clients. VMware provides native Horizon Clients for iOS, Android, Chrome, macOS, Windows, Linux, and Windows 10 UWP.

Alternatively, you can use the HTML Access web client by entering the URL of your Connection Server, using the following format:

```
https://<FQDN or IP address>
```

On the VMware Horizon web portal page that appears, you can click either the icon that takes you to the Horizon Clients download page or the icon for logging in using the HTML Access web client.

# Entitle End Users to Application Pools or Desktop Pools

Entitling users means specifying which users and groups are allowed to access the desktop or application. You can entitle users to an application pool or desktop pool when you create the pool. At the end of the Add Application Pool wizard or Add Desktop Pool wizard, you can select the Entitle users after this wizard finishes check box.

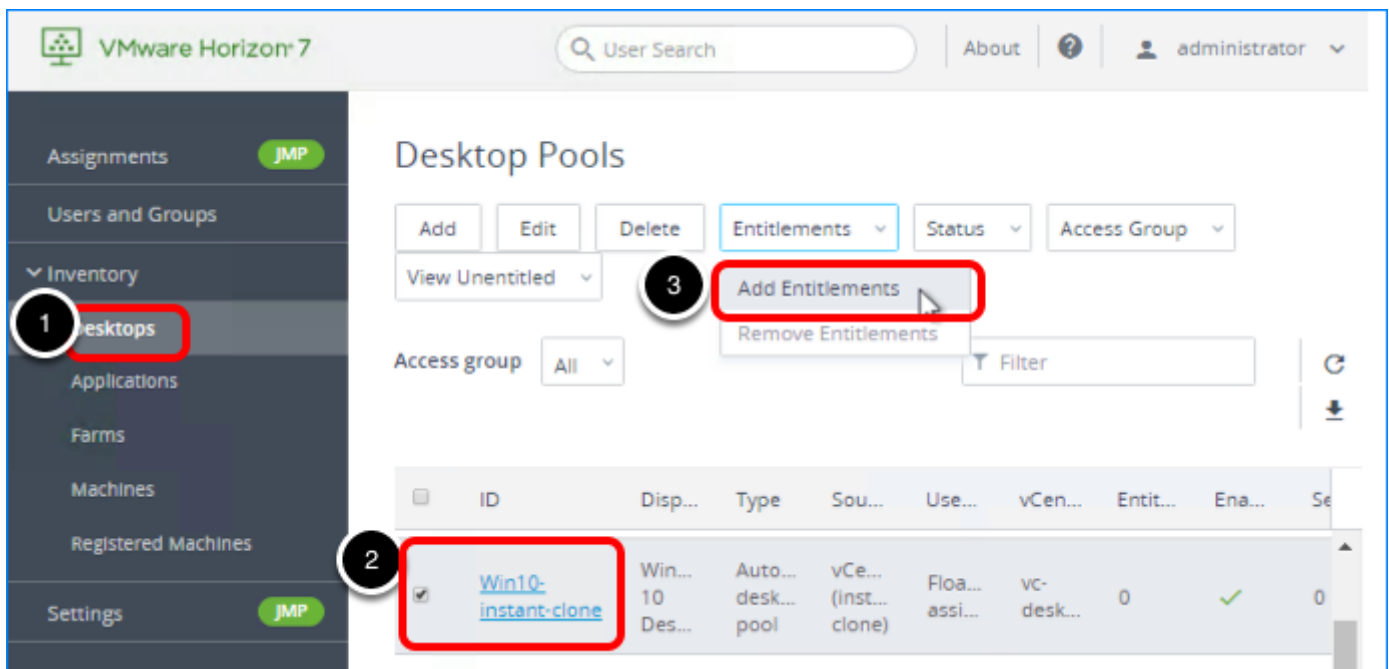

You can also create user entitlements after the pool is created, which is what we do in this exercise.

For this exercise, you will use the newest Horizon 7 management interface, the Horizon Console.

## Prerequisites for Entitling Users

Before you can entitle users, you must create a desktop or application pool. Exercises for performing these tasks are included in the chapters [Creating Single-User Desktop Pools](#) and [Creating RDSH-Published Desktops and Applications](#).

### 1. Start the Add Entitlements Wizard in the Horizon Console

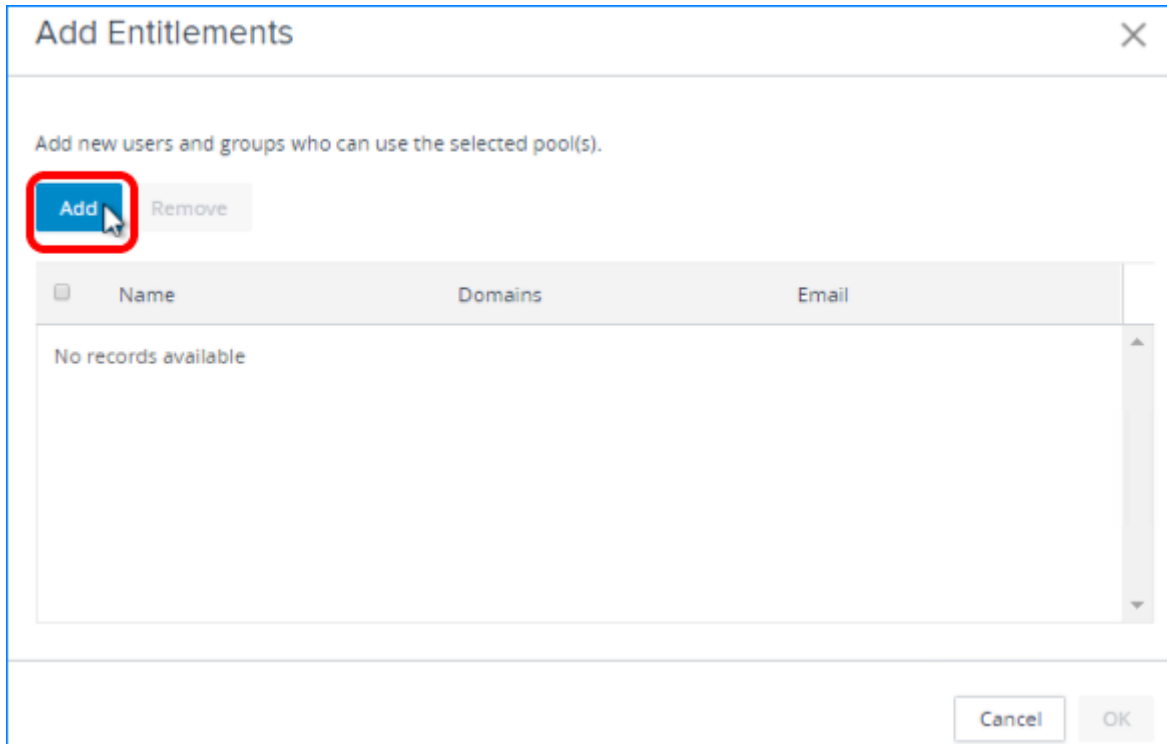

1. Log in to the Horizon Console, and select Inventory > Desktops or, for application pools, select Inventory > Applications.

The format of the URL for accessing the console is:

```
https://<connection-server-FQDN>/newadmin
```

2. Select the check box next to the name of the pool you want to entitle users to.  
**Important:** If you are entitling users to application pools, you can select multiple pools, and entitle users to all the selected pools. For desktop pools, you must select one pool at a time.
3. Select Entitlements > Add Entitlements.

## 2. Click Add to Add New Users

Click Add.

### 3. Search for Users and Groups

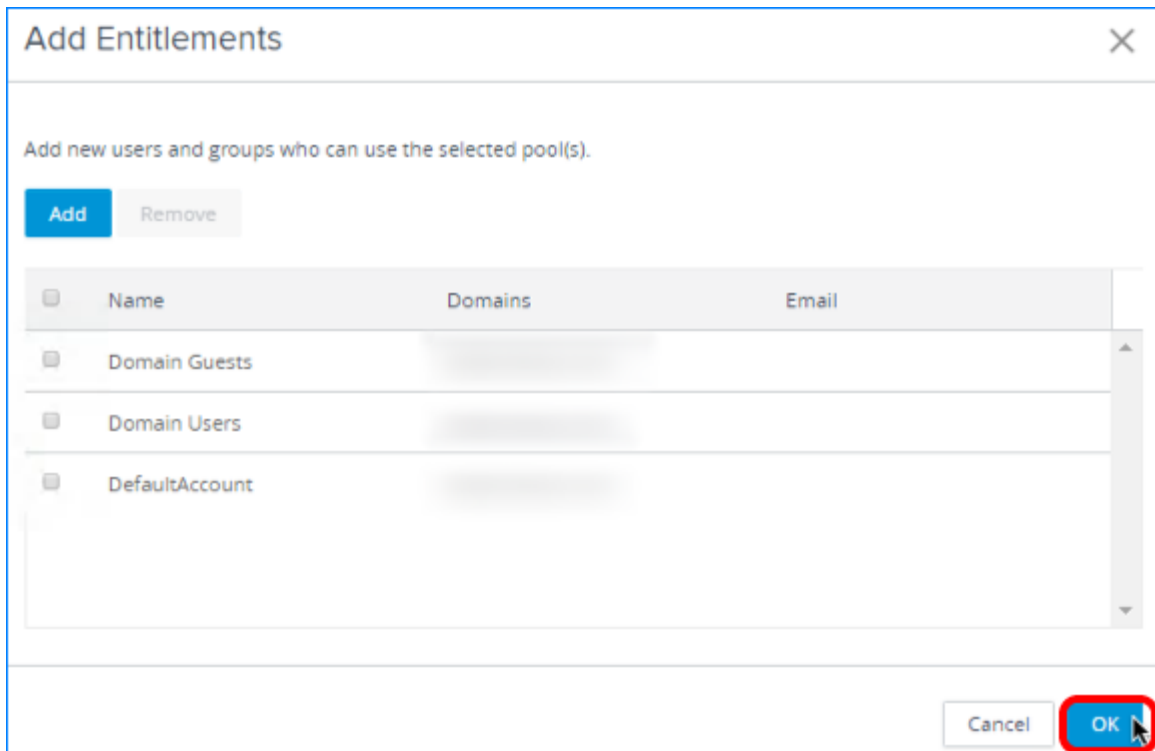

The screenshot shows the 'Find User or Group' dialog box. It has a title bar with a close button. Below the title bar, there are two checked checkboxes for 'Users' and 'Groups'. The 'Domain' dropdown is set to 'Entire Directory'. The 'Name/User name' section has a dropdown menu set to 'Starts with' and a text box containing 'd'. The 'Description' section has a dropdown menu set to 'Contains' and an empty text box. A red box highlights the 'Find' button, which is labeled with a circled '2'. A red box highlights the search criteria 'Starts with' and 'd', labeled with a circled '1'. A red box highlights the list of search results, labeled with a circled '3'. The list has columns for 'Name', 'User Name', 'Email', 'Description', and 'In Folder'. It contains three entries: 'Domain Guests', 'Domain Users', and 'DefaultAccount'. Each entry has a checked checkbox in the first column. A red box highlights the 'OK' button at the bottom right, labeled with a circled '4'.

	Name	User Name	Email	Description	In Folder
<input checked="" type="checkbox"/>	Domain Guests	Domain Guests/betavm...		All domain guests	
<input checked="" type="checkbox"/>	Domain Users	Domain Users/betavmw...		All domain users	
<input checked="" type="checkbox"/>	DefaultAccount	DefaultAccount... (DefaultAccount)		A user account managed by the system	

1. Use the **Name/User name** drop-down list and text box to search for users. For this example, we selected **Starts with** and entered a **D** so that all user and group names that begin with *D* will be returned.  
You can narrow your query using the drop-down menus to add search terms and modifiers. If you leave the text boxes empty, all users and groups are returned.
2. Click **Find**.
3. Scroll through the list and select the check boxes next to the names of the users and groups to entitle.
4. Click **OK**.

## 4. Click OK to Add Entitlements

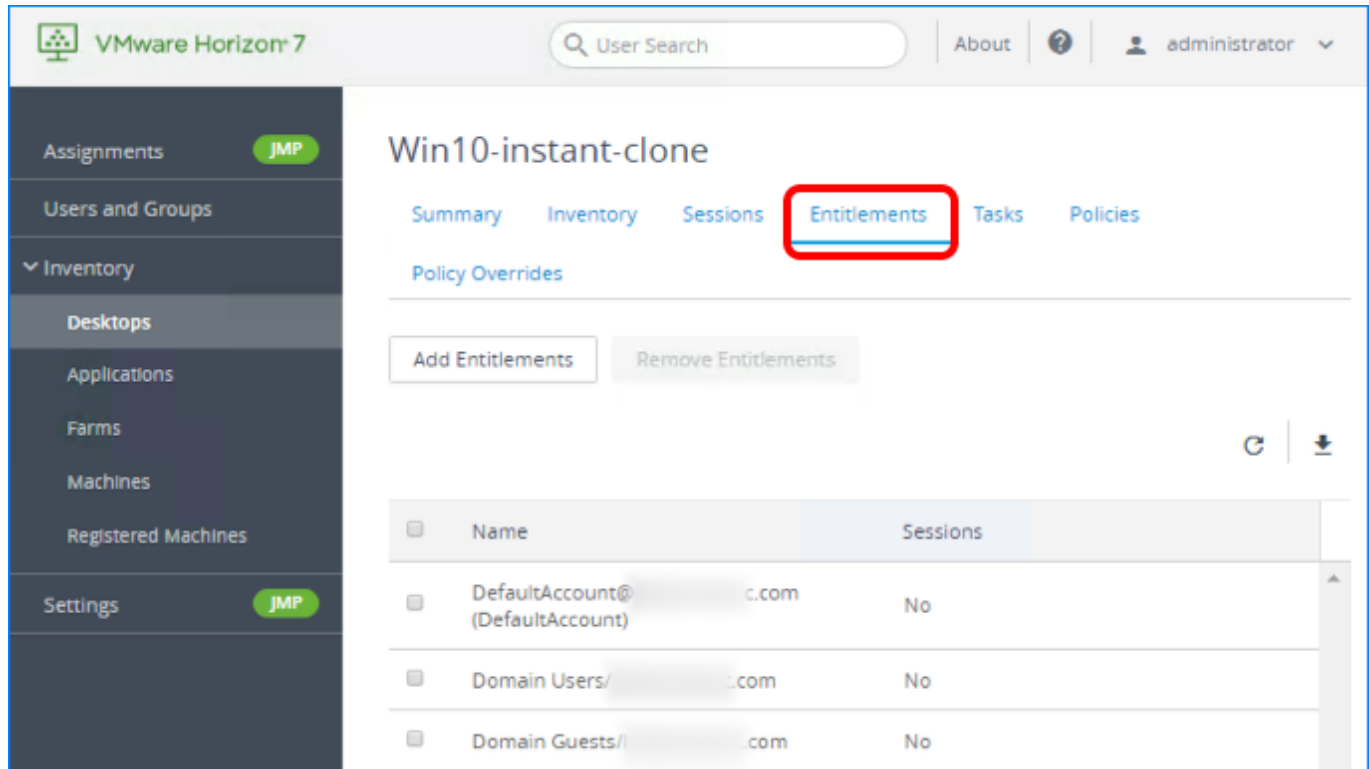

Click OK.

**Note:** The **Add** button in this dialog box is for adding additional users to the list. The check boxes are for selecting a user or users you want to remove.

You are returned to the Application Pools list or the Desktop Pools list.

## 5. Verify That Entitlements Have Been Added

The screenshot shows the VMware Horizon 7 console interface. The left sidebar contains navigation options: Assignments (with a JMP badge), Users and Groups, Inventory (expanded), Desktops (selected), Applications, Farms, Machines, Registered Machines, and Settings (with a JMP badge). The main content area is titled 'Win10-instant-clone' and features tabs for Summary, Inventory, Sessions, Entitlements (highlighted with a red box), Tasks, and Policies. Below the tabs is a 'Policy Overrides' section with 'Add Entitlements' and 'Remove Entitlements' buttons. A table displays the current entitlements for the pool:

<input type="checkbox"/>	Name	Sessions
<input type="checkbox"/>	DefaultAccount@...com (DefaultAccount)	No
<input type="checkbox"/>	Domain Users/...com	No
<input type="checkbox"/>	Domain Guests/...com	No

Click the name of the desktop or application pool in the list of pools, and select the **Entitlements** tab.

**Note:** You can also use the buttons on the **Entitlements** tab to add and remove user entitlements for a specific pool.

# Configure Unauthenticated Access to Published Applications

In this exercise, you set up the system so that end users can access RDSH-published application pools without having to authenticate first. Use this feature to provide unauthenticated access if your users require access to a seamless application that has its own security and user management, or for kiosk use cases.

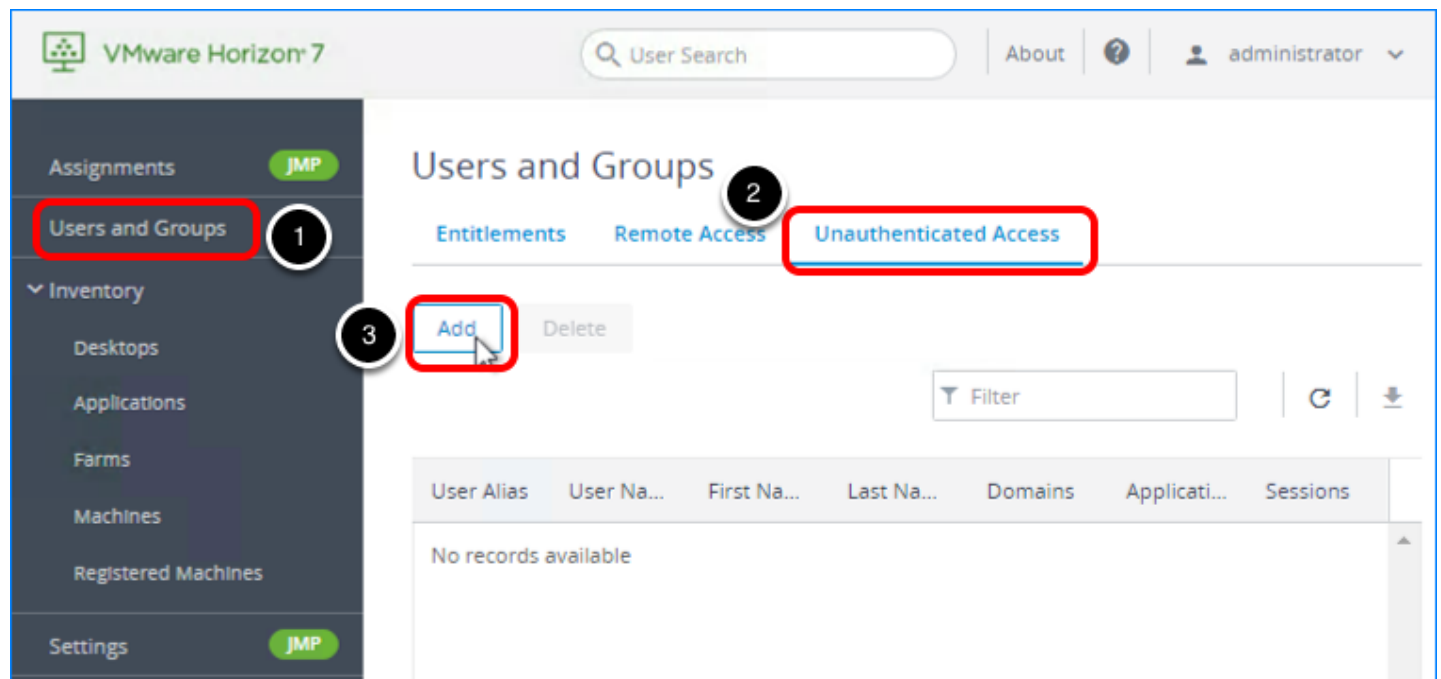

For this exercise, you will use the newest Horizon 7 management interface, the Horizon Console, to add and entitle an unauthenticated user. You will use the Horizon Administrator UI to configure unauthenticated access for a specific Connection Server.

## Prerequisites for Configuring Unauthenticated Access

To perform this exercise, you need to have created a user account, not a user group, in Active Directory that will be used for unauthenticated access. For this example, we created a user account named `Unauthenticated User`.

Be sure to create a user account that will not be used for any other purpose. If you select a user with desktop entitlements and make the user an unauthenticated access user, the user will not have access to the entitled desktops.

### 1. Start the Unauthenticated Access User Wizard

1. Log in to the Horizon Console, and select Users and Groups.

The format of the URL for accessing the console is:

```
https://<connection-server-FQDN>/newadmin
```

2. Select the Unauthenticated Access tab.
3. Click Add.

## 2. Select the User Account to Designate for Unauthenticated Access

**Add unauthenticated access user**

1 User

2 Settings

Domain: Entire Directory

Name/User name: 1 Starts with un

Description: Contains

2 Find

Name	User Name	Email	Description	In Folder
Unauthentica... User	unauthen@b... (Unauthentic... User)			

3

4 Next

Cancel Previous Next Submit

1. Use the **Name/User name** drop-down list and text box to search for users. For this example, we selected **Starts with** and entered a **Un** so that all user and group names that begin with **Un** will be returned.  
You can narrow your query using the drop-down menus to add search terms and modifiers. If you leave the text boxes empty, all users and groups are returned.
2. Click **Find**.
3. Scroll through the list and select the user account.
4. Click **Next**.

### 3. Enter a User Alias

Add unauthenticated access user

✓ User

2 Settings

\* User Alias:

1 Unauthenticated-User

User Name:

...com\Unauthenticated User

Comments:

2 Submit

Cancel Previous Next

1. Enter an alias for the account. For this example, because the user name was `Unauthenticated User`, which has a space between the words, we added a hyphen to create the alias. Spaces are not allowed.
2. Click **Submit**.

The user account is added to the list of users who have unauthenticated access.

VMware Horizon 7

## 4. Edit the Connection Server Configuration

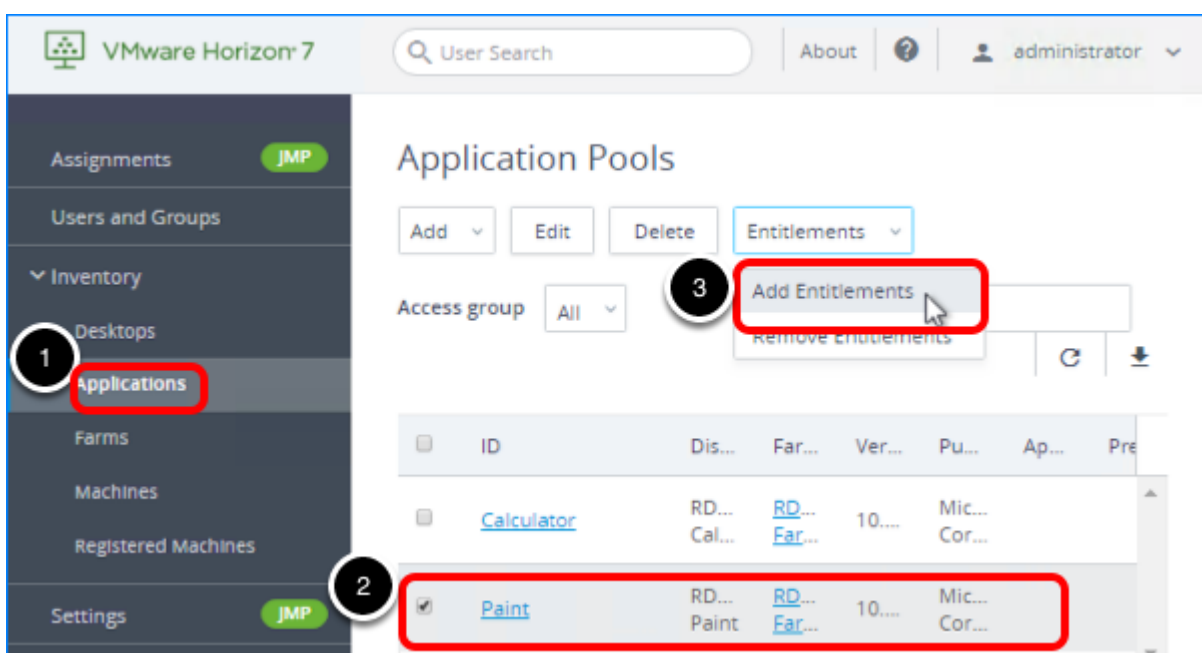

1. Log in to the Horizon Administrator, and select View Configuration > Servers.  
The format of the URL for accessing the console is:  
`https://<connection-server-FQDN>/admin`
2. Select the Connection Servers tab.
3. Click Edit.

## 5. Configure the Authentication Settings for Unauthenticated Access

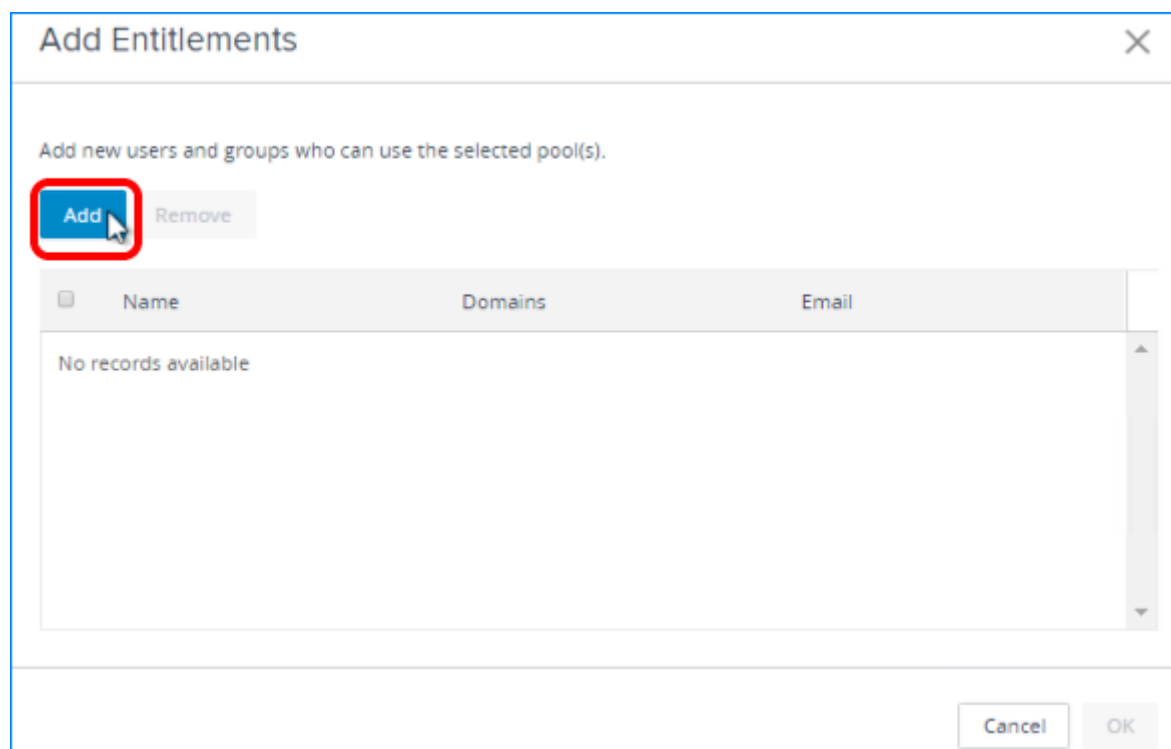

1. Scroll down to the View Authentication section, and set Unauthenticated Access to Enabled.
2. In the Default unauthenticated access user drop-down list, select the user account you added; for this example, `Unauthenticated-User`.
3. Click OK.

## 6. Start the Add Entitlement Wizard in Horizon Console

1. Log in to the Horizon Console, and select **Inventory > Applications**.  
The format of the URL for accessing the console is: <https://<connection-server-FQDN>/newadmin>
2. Select the check box next to the name of the pool you want to entitle users to.  
You can select multiple pools.
3. Select **Entitlements > Add Entitlements**.

## 7. Click Add to Add the New User

Click **Add**.

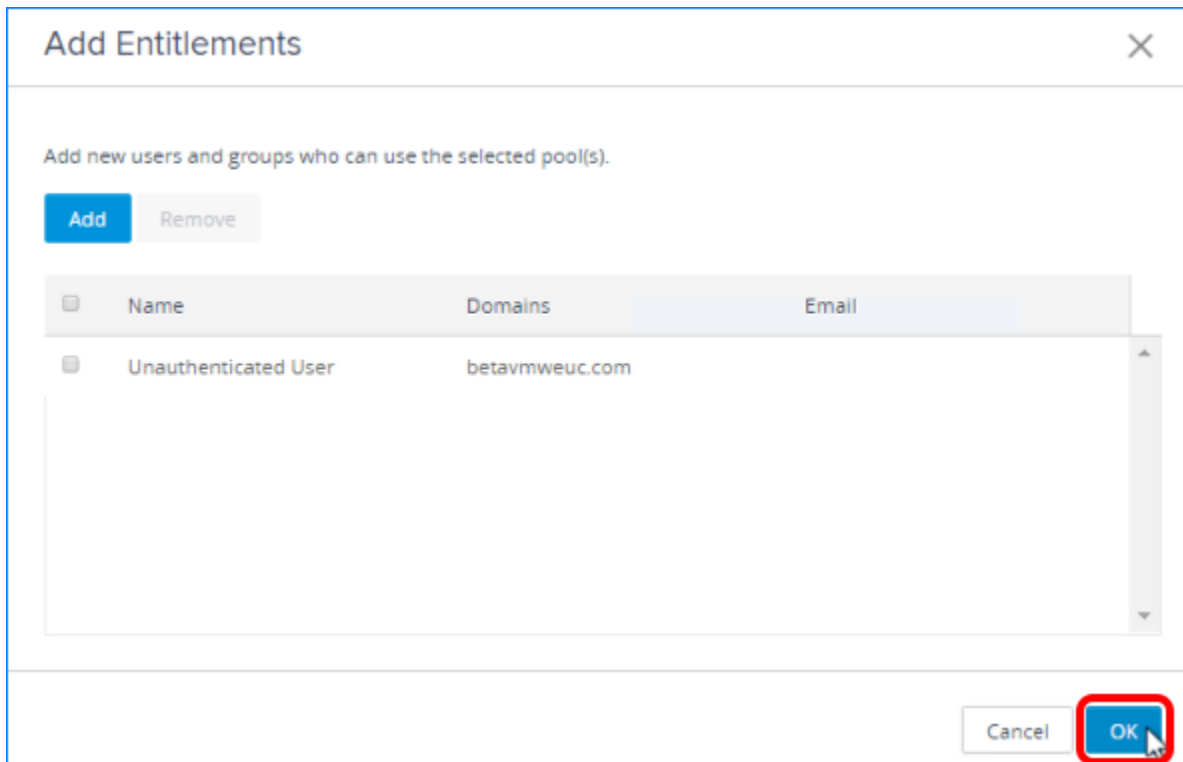

## 8. Select the User Account for Entitling Unauthenticated Access to This Pool

The screenshot shows the 'Find User or Group' dialog box. It has a title bar with a close button. Below the title bar, there are three radio buttons under the 'Type:' label: 'Users', 'Groups', and 'Unauthenticated users'. The 'Unauthenticated users' radio button is selected and circled with a red box and a black circle containing the number 1. Below this is a 'Domain:' dropdown menu set to 'Entire Directory'. Under 'Name/User name:', there is a dropdown menu set to 'Contains' and a text box containing 'un'. Both are circled with a red box and a black circle containing the number 2. Below this is a 'Description:' dropdown menu set to 'Contains' and an empty text box. A red box and a black circle containing the number 3 are around the 'Find' button. Below the search fields is a table with columns: 'Name', 'User Name', 'Email', 'Description', and 'In Folder'. The first row is highlighted with a red box and a black circle containing the number 4. The row contains a checked checkbox, 'Unauthenticated User', 'unauthen@b...', '(Unauthenticated User)', and an empty 'In Folder' cell. At the bottom right, there are 'Cancel' and 'OK' buttons. The 'OK' button is circled with a red box and a black circle containing the number 5.

	Name	User Name	Email	Description	In Folder
<input checked="" type="checkbox"/>	Unauthenticated User	unauthen@b...	(Unauthenticated User)		

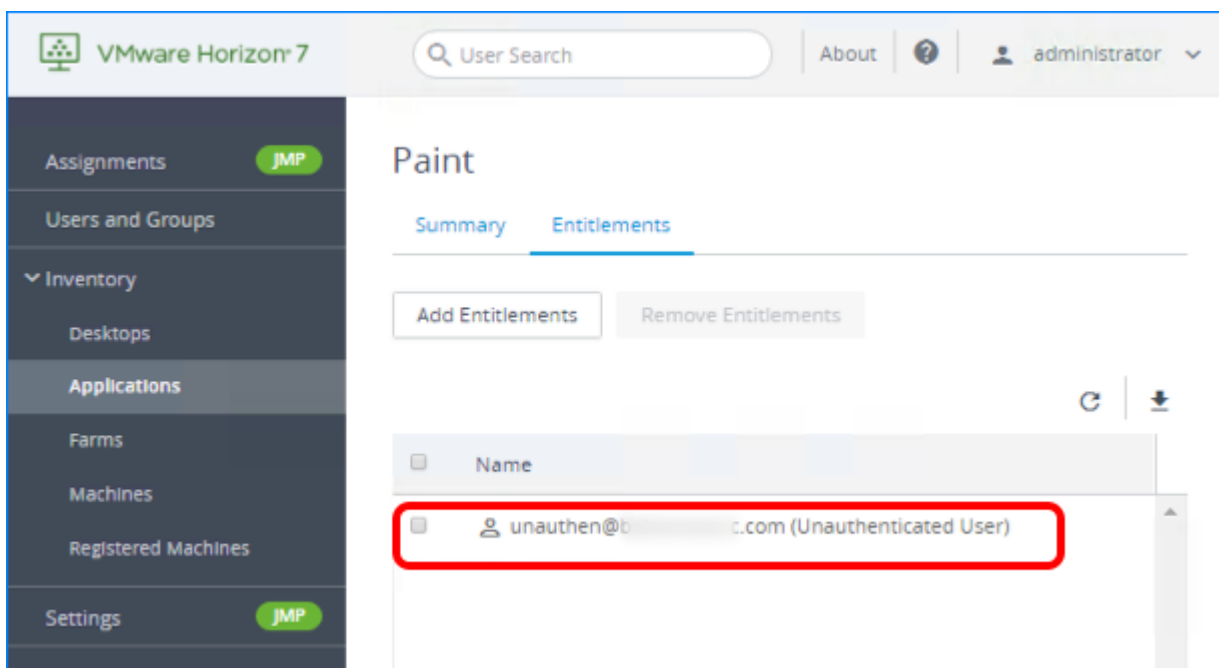

1. Select the **Unauthenticated users** check box.
2. Use the **Name/User name** drop-down list and text box to search for the user. For this example, we selected **Starts with** and entered a **Un** so that all user and group names that contains **Un** will be returned.  
You can narrow your query using the drop-down menus to add search terms and modifiers. If you leave the text boxes empty, all users and groups are returned.
3. Click **Find**.
4. Scroll through the list and select the check box next to the name of the user entitle.
5. Click **OK**.

## 9. Click OK to Add the Entitlement

Click OK.

## 10. Verify That Entitlement Has Been Added

Click the name of the application pool in the list of pools, and select the **Entitlements** tab.

**Important:** At the time of this writing, the latest client software release is Horizon Client 4.8, and this feature is available only for the HTML Access web client, and for Linux, Windows, Android, and Chrome OS client devices. Part of the exercise [Use Horizon Client from a PC or Laptop](#) gives step-by-step instructions for using this feature to access published applications anonymously.

For a complete list of rules and guidelines for configuring unauthenticated users, see the product documentation topic [Providing Unauthenticated Access for Published Applications](#).

# Use Horizon Client from a PC or Laptop

After you have finished deploying virtual desktops or published applications and entitling users, you are ready to explore end-user connection options. This exercise guides you through using VMware Horizon Client™ on a PC or laptop endpoint, which include Windows, macOS, and Linux.

## Prerequisites for Connecting to a Desktop or Application with Horizon Client

To perform this exercise, you need the following:

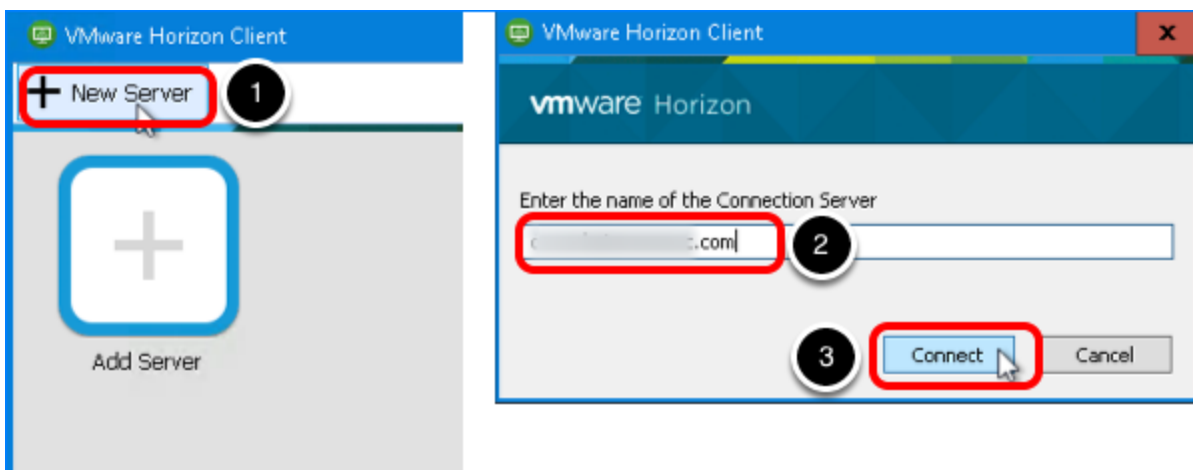

- **Endpoint PC** – You can use a Mac, Linux, or Windows PC. For this exercise, do not use a device with a Windows 10 UWP operating system because the unauthenticated user access feature is not yet available for that OS.
- **Installer** – Go to the [Download VMware Horizon Clients](#) page, and download and install the free Horizon Client software.
- **User account** – To install the Horizon Client software, you must log in to the endpoint device as a user with administrative privileges.
- **Connection Server address** – Verify that you have the fully qualified domain name of the Connection Server that brokers connections to the desktop and application pools you created in earlier exercises.
- **Desktop or application pools** – Exercises for creating pools are included in the chapters [Creating Single-User Desktop Pools](#) and [Creating RDSH-Published Desktops and Applications](#).
- **Configuration of unauthenticated access** – To connect anonymously to a published application, you must have performed the exercise [Configure Unauthenticated Access to Published Applications](#).

## 1. Start Horizon Client

Start VMware Horizon Client the same way you would start any application. For example, on a Windows PC, double-click the desktop icon.

## 2. Connect to the Connection Server

1. Click **New Server**.
2. When prompted, enter the FQDN of the Connection Server.
3. Click **Connect**.

### 3. Click Continue If You Receive a Security Warning

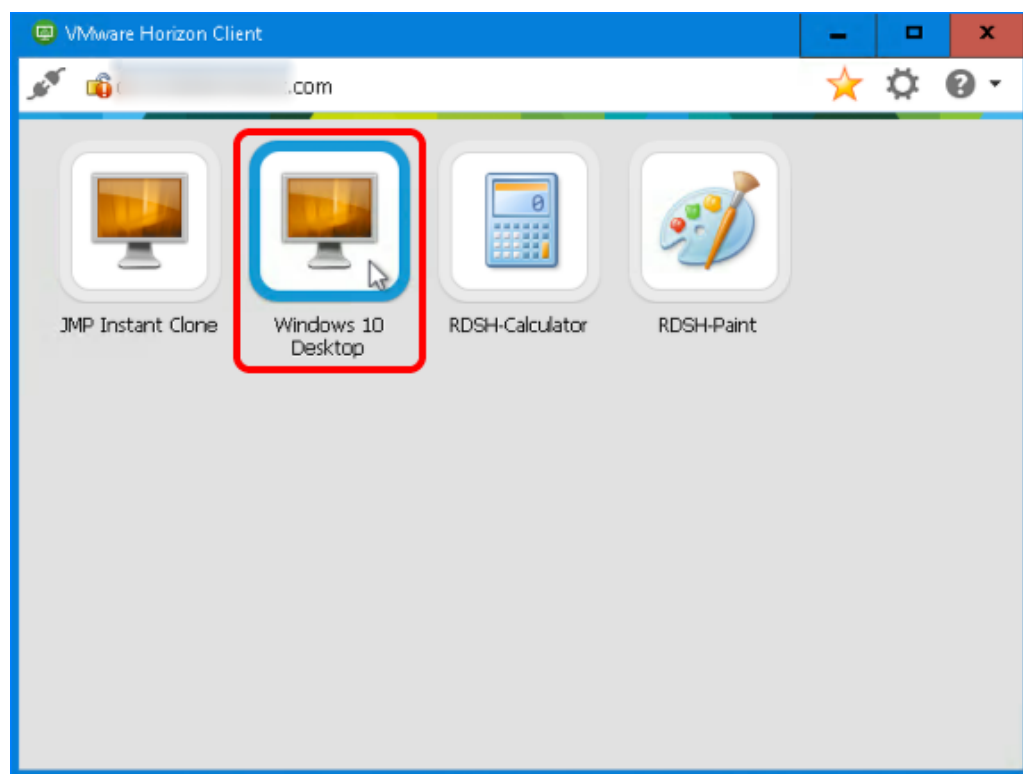

Click **Continue** to bypass the certificate warning. If you install a CA-signed security certificate on the machine that hosts the Connection Server, this warning does not appear.

### 4. Supply User Credentials

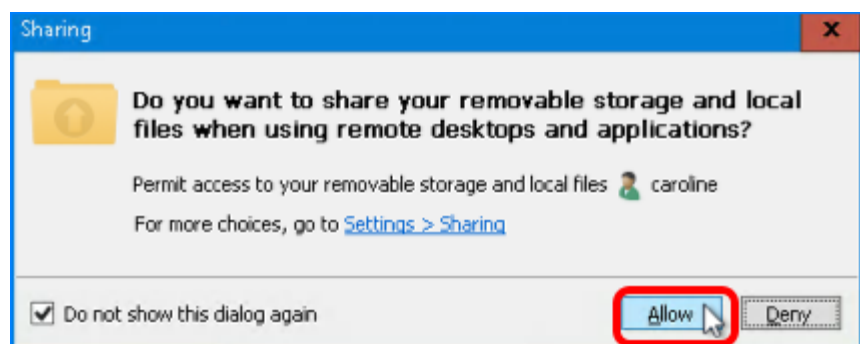

Enter credentials of a user who is entitled to desktops and published applications, and click **Login**.

## 5. Launch a Desktop or Application

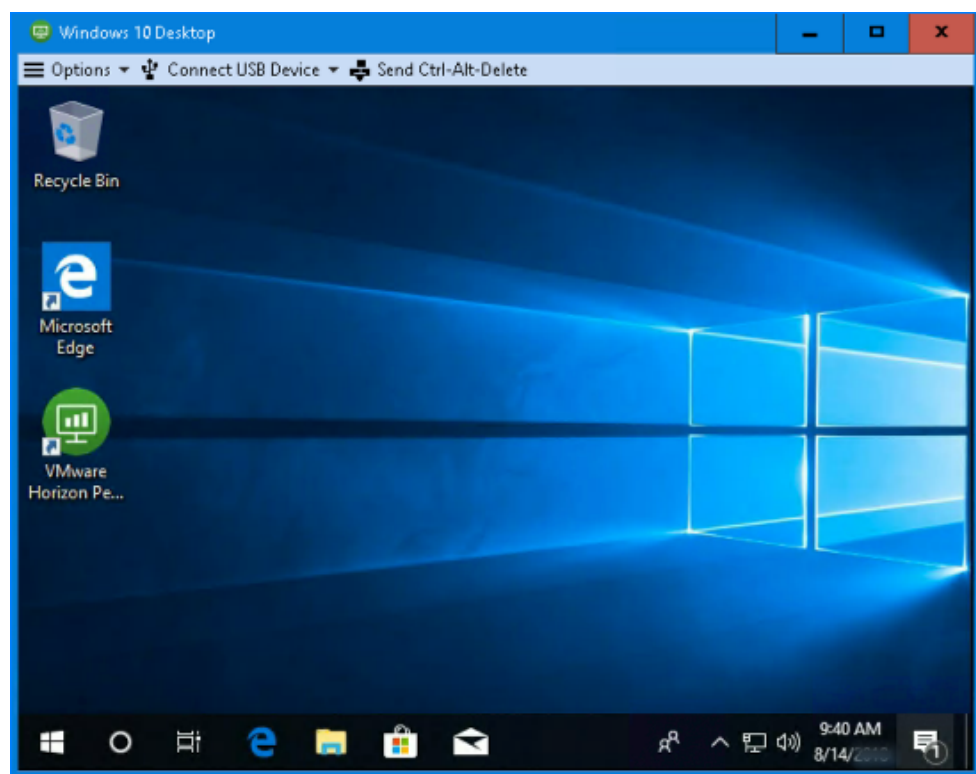

To launch an application or desktop, double-click the icon for the application or desktop.

## 6. Allow Sharing of Removable Storage and Local Files

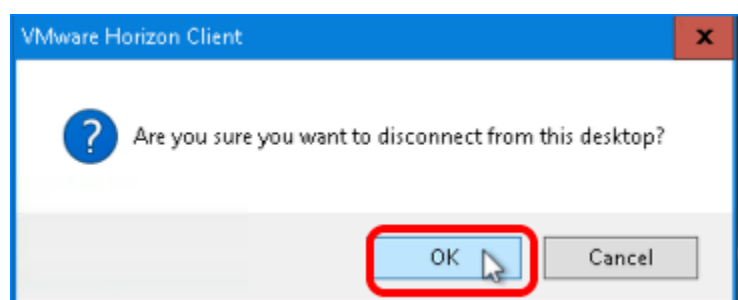

Click **Allow** to allow access to files on your client device, as well as locally connected storage devices such as USB thumb drives, while using virtual desktops and published applications.

## 7. Verify a Successful Connection

Verify that you have successfully logged in to your desktop or application. For this example, we have successfully logged in to an instant-clone VM from the Windows 10 Desktop pool.

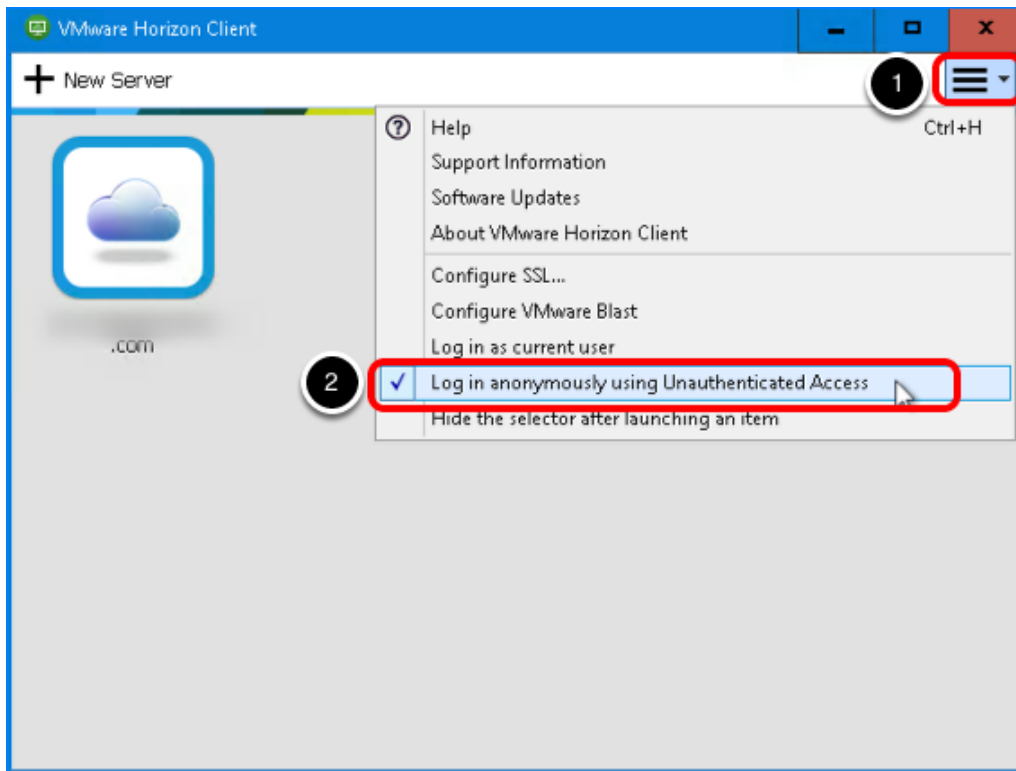

## 8. Disconnect from the Session and Exit

1. Close the window as you normally would, and, for desktops, confirm that you want to disconnect.
2. Quit Horizon Client.
3. Restart Horizon Client.

## 9. Select to Log In to Published Applications Anonymously

1. In Horizon Client, click the **Settings** toolbar button.
2. Click to place a check mark in front of **Log in anonymously using Unauthenticated Access**.

**Important:** At the time of this writing, the latest release is Horizon Client 4.8, and this feature is available only for the HTML Access web client and for Linux, Windows, Android, and Chrome OS client devices.

## 10. Connect to the Server

Double-click the server icon.

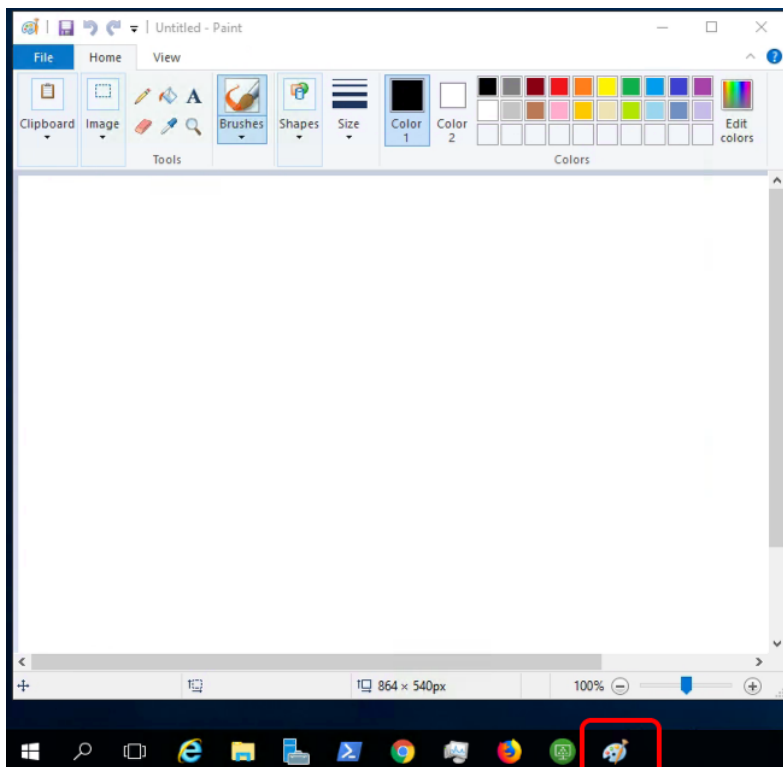

Instead of being prompted to enter user credentials, you will see the application selector screen, displaying all the published applications that are configured for unauthenticated user access. If no applications appear in the selector, you need to complete the exercise [Configure Unauthenticated Access to Published Applications](#).

## 11. Launch the Application

Double-click the icon for the application.

## 12. Verify Unauthenticated Access

Note that the application window looks just like it would if it were a locally installed application.

The application icon for the published application appears in the taskbar just as it would for a locally installed application.

The screenshots in this exercise showed the Windows-based client and seamless integration into the Windows user experience. If you install Horizon Client on other operating systems, such as macOS or Linux, the experience of using Horizon Client is likewise integrated into those operating systems and their OS-specific features.

**Tip:** If you have problems logging in anonymously, see the complete list of rules and guidelines for configuring unauthenticated users, available in the product documentation topic [Providing Unauthenticated Access for Published Applications](#).

# Use the HTML Access Web Client

You can connect to virtual desktops and published applications from an HTML5-enabled web browser. The supported web browsers are

- Chrome
- Internet Explorer
- Microsoft Edge
- Firefox
- Safari

The versions of browsers supported depend on the client operating system. For details about supported client operating systems and browser versions, see the [VMware Horizon HTML Access User Guide](#).

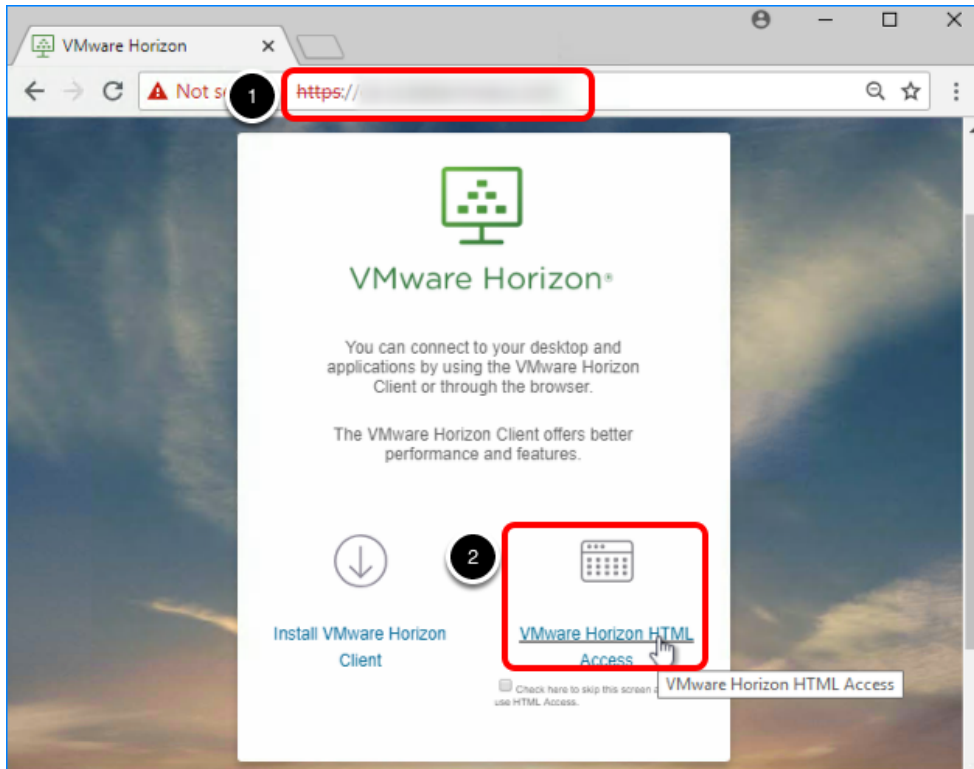

**Important:** The desktop or application you are connecting to through HTML Access must be in a pool with the HTML Access feature enabled. The exercises in this quick-start guide directed you to enable HTML Access when creating pools.

## Prerequisites for Connecting to a Desktop or Application with HTML Access

To perform this exercise, you need the following:

- **Connection Server address** – Verify that you have the fully qualified domain name of the Connection Server that brokers connections to the desktop and application pools you created in earlier exercises.
- **Desktop or application pools** – Exercises for creating pools are included in the chapters [Creating Single-User Desktop Pools](#) and [Creating RDSH-Published Desktops and Applications](#).

# 1. Use a Browser to Launch HTML Access

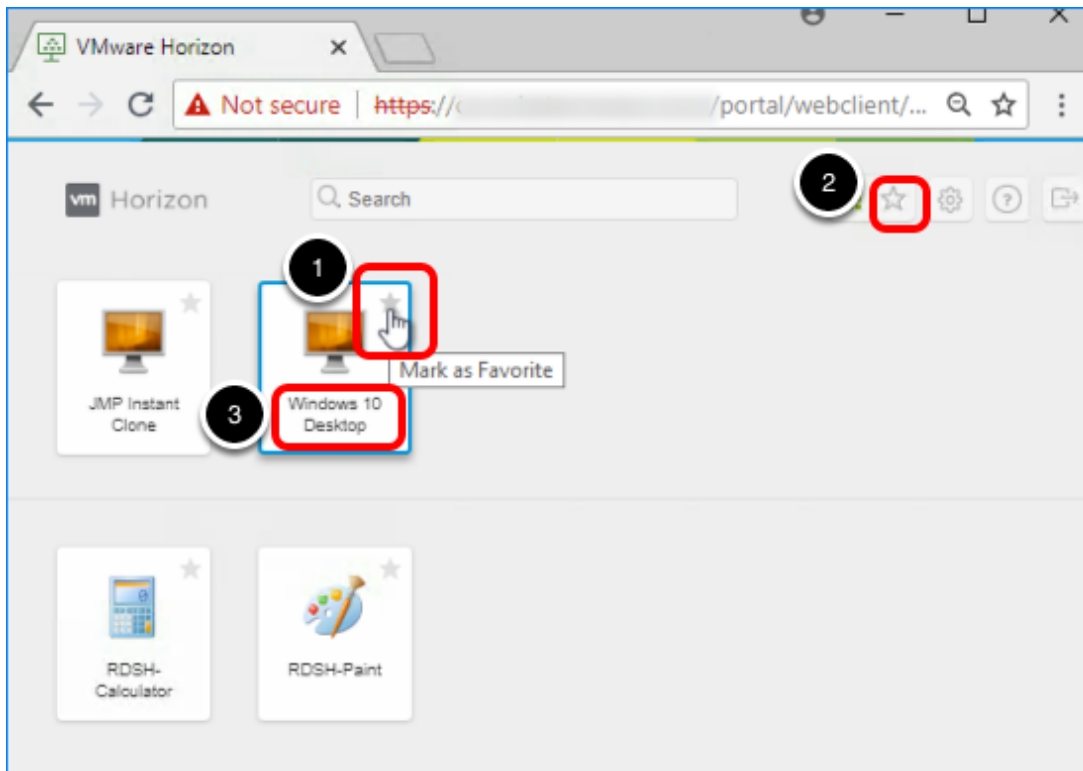

1. Open a supported web browser and enter the address of your Connection Server. The URL format is `https://<connection-server-FQDN>`  
Note: If you do not have a CA-signed security certificate, you might be prompted to add a security exception to your browser.
2. Click **VMware Horizon HTML Access**.

## 2. Log In to the Server

Enter credentials of a user who is entitled to the desktop or application pool, and click **Login**. After the credentials are validated, you can see the available desktops and applications.

### 3. Mark an Item as a Favorite

1. Click a star in one of the desktop icons to mark the desktop as a favorite.  
This feature is convenient if you have many desktops and applications and do not want to have to scroll to find the applications and desktops you use most frequently.
2. Click the Star toolbar button to display only favorites.
3. Click the desktop icon, rather than the star, to launch the desktop in your browser.

**Note:** You can also use the Search field to quickly locate an application or desktop if you know its display name.

#### 4. Click an Icon to Launch a Desktop and Then Open the Sidebar

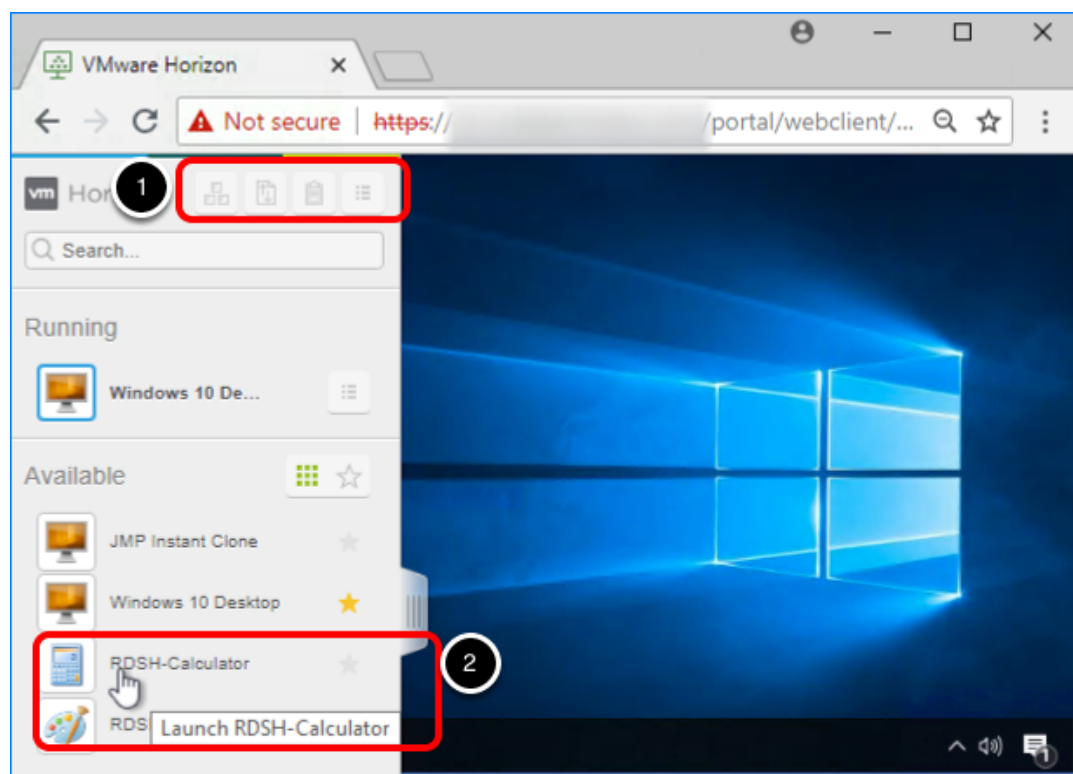

Click the tab on the left side of the screen to open the navigation sidebar.

**Note:** The green desktop shortcut is for the VMware Horizon Performance Tracker. You selected to install this component when you installed Horizon Agent in the master VM.

## 5. Open a Published Application Using the Sidebar

1. Hover your cursor over each toolbar button to display its tooltip.

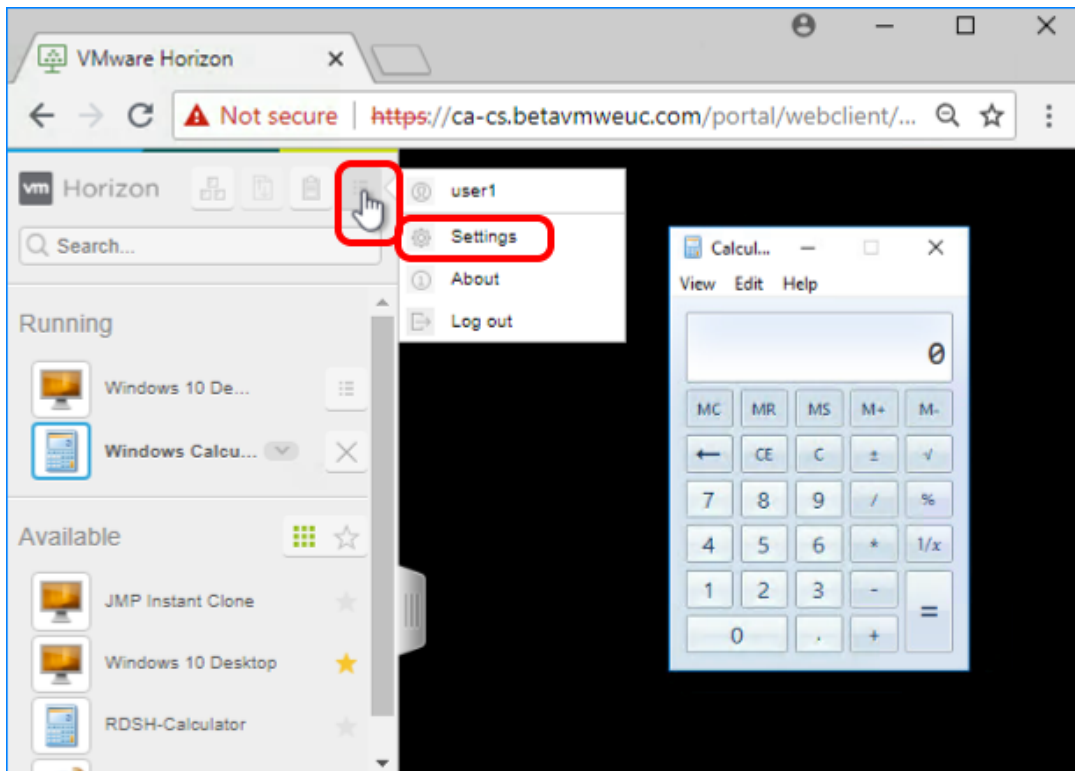

You can use the toolbar at the top of the sidebar to

- Send Ctrl+Alt+Del to the application work area
- Transfer files, if the feature is enabled
- Open the Copy & Paste panel
- Open the Settings menu

2. Click an application in the sidebar to launch it.

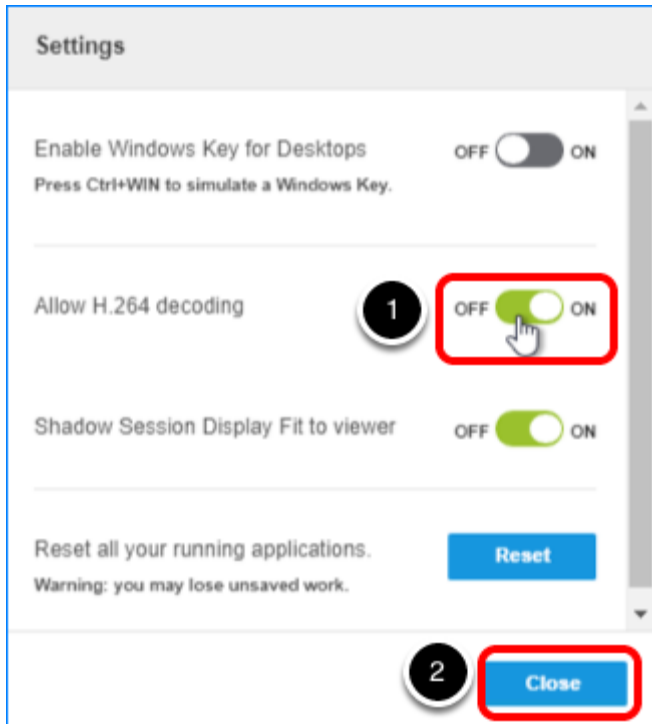

**Note:** In the sidebar, you can click the star icon to the right of an application or desktop name to designate the item as a favorite, and click the star above the list to display only favorites.

## 6. Examine the Settings Available Through the Sidebar

Click the **Menu** toolbar button, and select **Settings**.

## 7. Turn On Hardware Decoding

1. Click the toggle button to set **Allow H.264 decoding** to **On**.
2. Click **Close**.

When you use a Chrome browser and use the VMware Blast Extreme display protocol, this setting causes the graphics processor on the client device to do the work involved in playing back video and images. Hardware decoding offloads the work to the GPU, so that CPU consumption is reduced, resulting in less device power consumed, for longer battery life. To make the setting take effect, you must disconnect and reconnect to the desktop or application.

For information about the **Shadow Session Display Fit to viewer** setting, see the product documentation topic [Using the Session Collaboration Feature](#).

## 8. Disconnect from the Desktop

In the list of running desktops and applications, click the **Menu** toolbar button next to the desktop and select **Close**, or close the browser tab or window.

This exercise described using the HTML Access web client, which does not require installing any software on the client device. For information about HTML Access features such as copying and pasting or transferring files between your local client system and the virtual desktop or published application, see the [HTML Access documentation](#).

This exercise described logging in as an entitled user. For information about logging in using unauthenticated user access, see the product documentation topic [Use Unauthenticated Access to Connect to Published Applications](#).

# Use Horizon Client from a Mobile Device

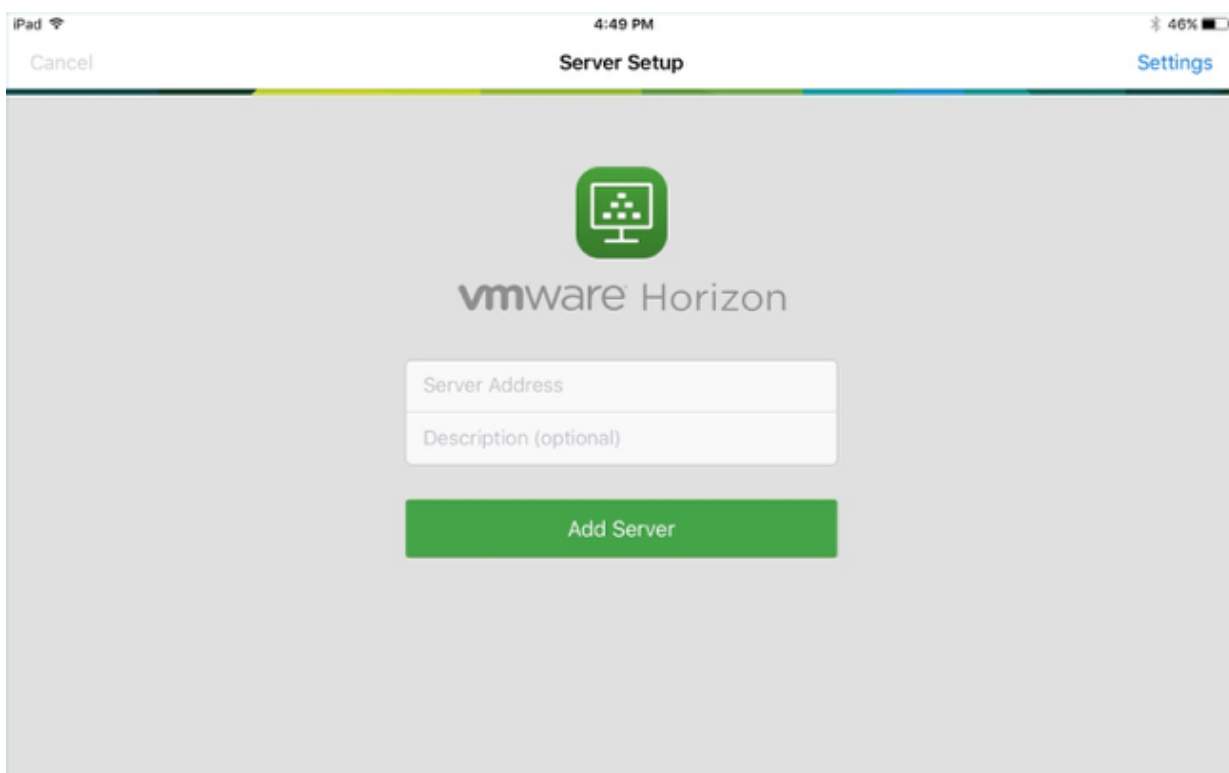

This exercise guides you through using the iOS Horizon Client on an iPad, though Horizon Clients are also available for Android, Windows 10 UWP, and Chromebook mobile devices.

## Prerequisites for Connecting to a Desktop or Application with Horizon Client

To perform this exercise, you need the following:

- **Installer** – On your mobile device, go to the [Download VMware Horizon Clients](#) page, and download and install the free Horizon Client software.
- **Connection Server address** – Verify that you have the fully qualified domain name of the Connection Server that brokers connections to the desktop and application pools you created in earlier exercises.
- **Desktop or application pools** – Exercises for creating pools are included in the chapters [Creating Single-User Desktop Pools](#) and [Creating RDSH-Published Desktops and Applications](#).

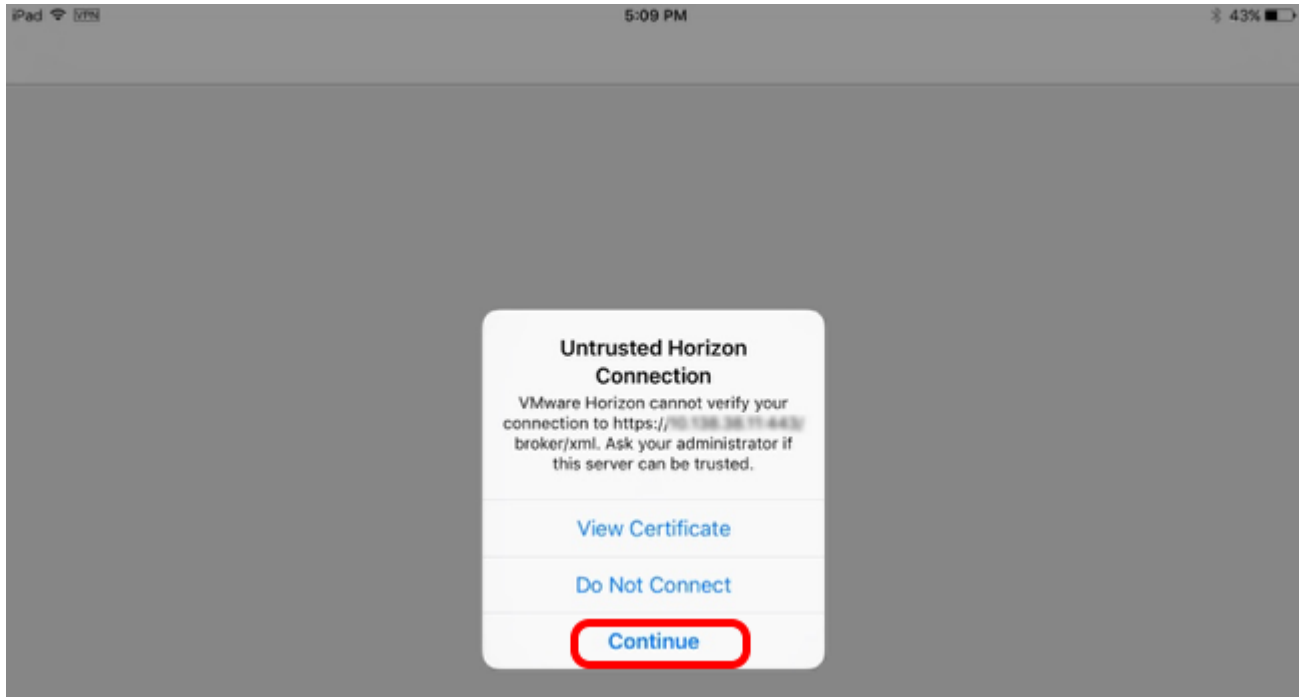

### 1. Start Horizon Client

Launch Horizon Client, enter the FQDN of the Connection Server in the **Server Address** text box, and tap **Add Server**.

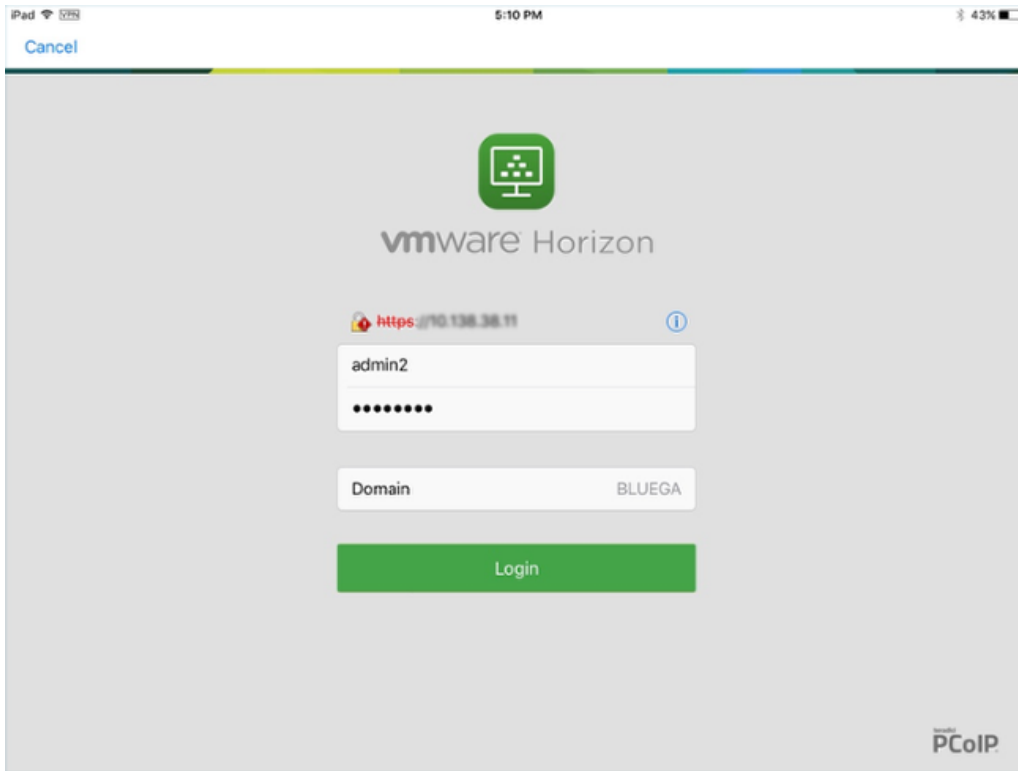

**Tip:** If you are using the default self-signed SSL certificate, an Untrusted View Connection warning appears. You can modify the Horizon Client security settings by tapping the **Settings** link in the upper-right corner.

## 2. Click Continue to Accept the Self-Signed Certificate

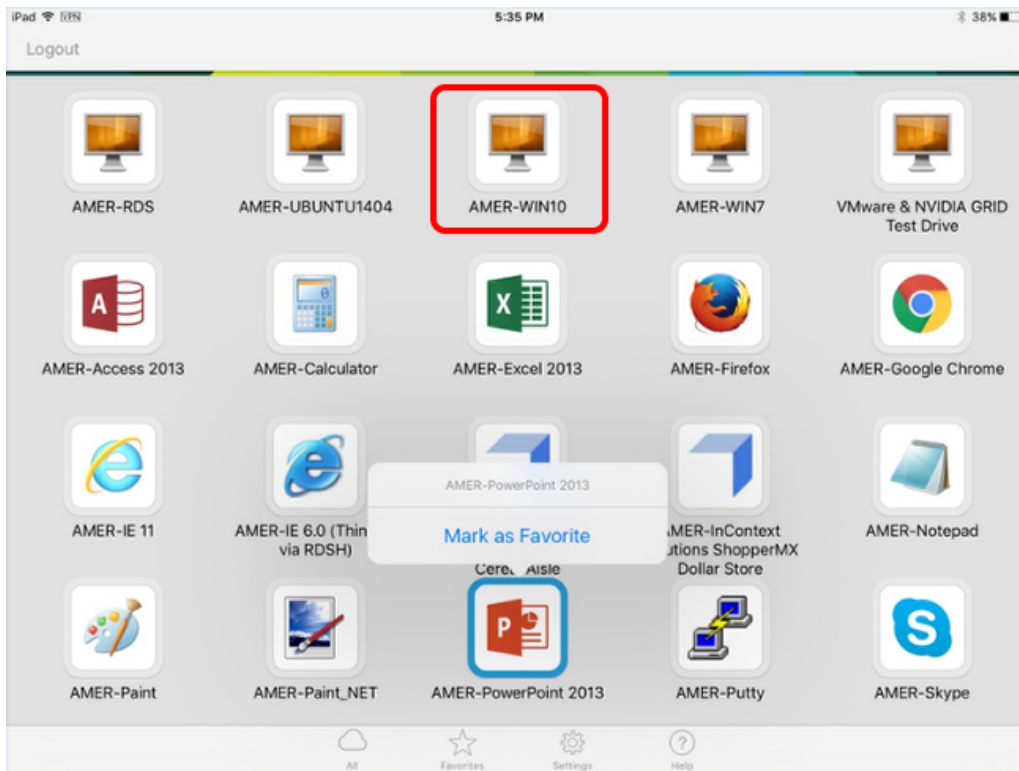

If prompted about an untrusted Horizon connection, click **Continue**.

### 3. Log In to the Connection Server

Enter the credentials of a user who is entitled to the desktop or application pool.

## 4. Launch a Desktop

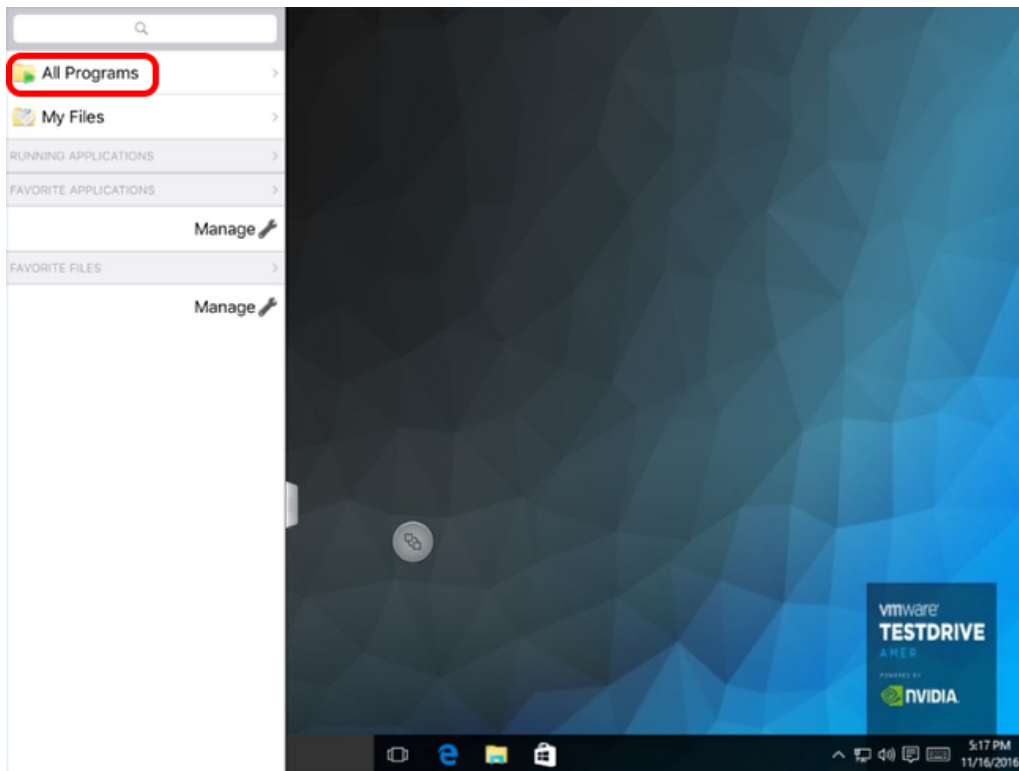

On the desktop and application selector page, tap a desktop icon to connect to a virtual desktop.

**Tip:** You can tap and hold an icon to display a context menu and mark the item as a favorite. Tap **Favorites** at the bottom of the screen to display only items marked as favorites.

The Unity Touch sidebar appears on the left side of the screen. If you are connected to a desktop, the sidebar provides the functionality of a typical Windows Start menu without having to maneuver your touch screen to use the Start menu. If the sidebar is closed, you can slide the tab to the right to open the sidebar.

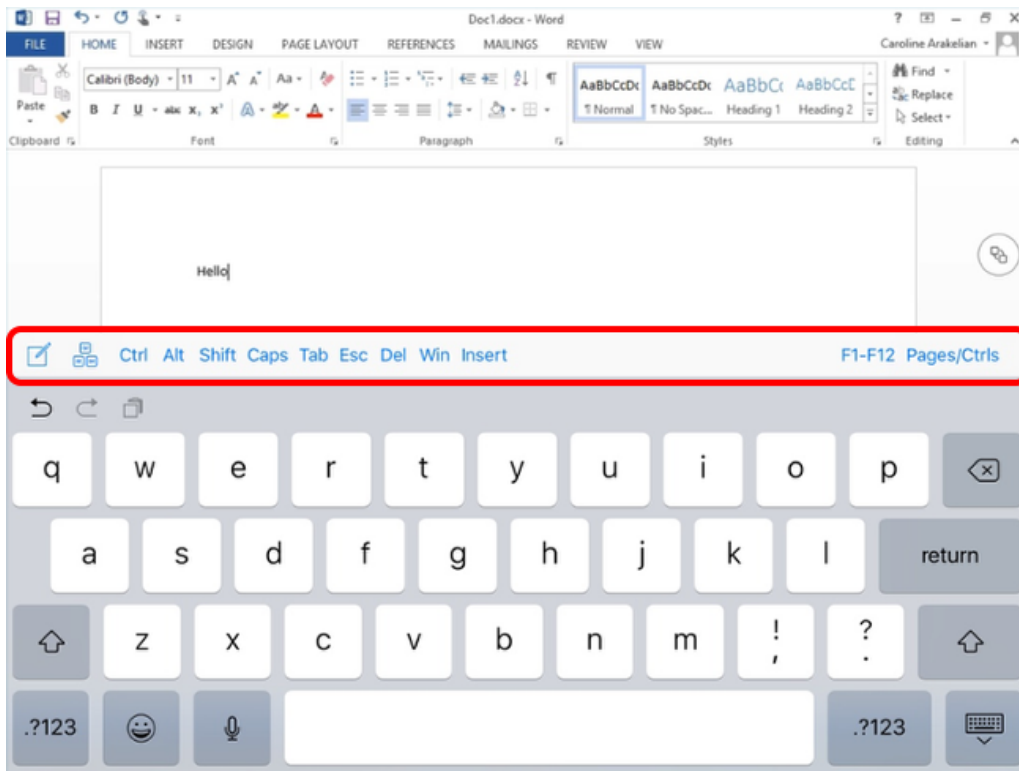

## 5. Tap All Programs and Select an Application

Tap **All Programs** in the sidebar and tap an application such as a word-processing or spreadsheet application, which allows you to enter text.

**Tip:** For convenience, to keep favorite applications or files listed in the sidebar, tap **Manage** under **FAVORITE APPLICATIONS** or **FAVORITE FILES** and select your favorites.

## 6. Enter Text in the Application

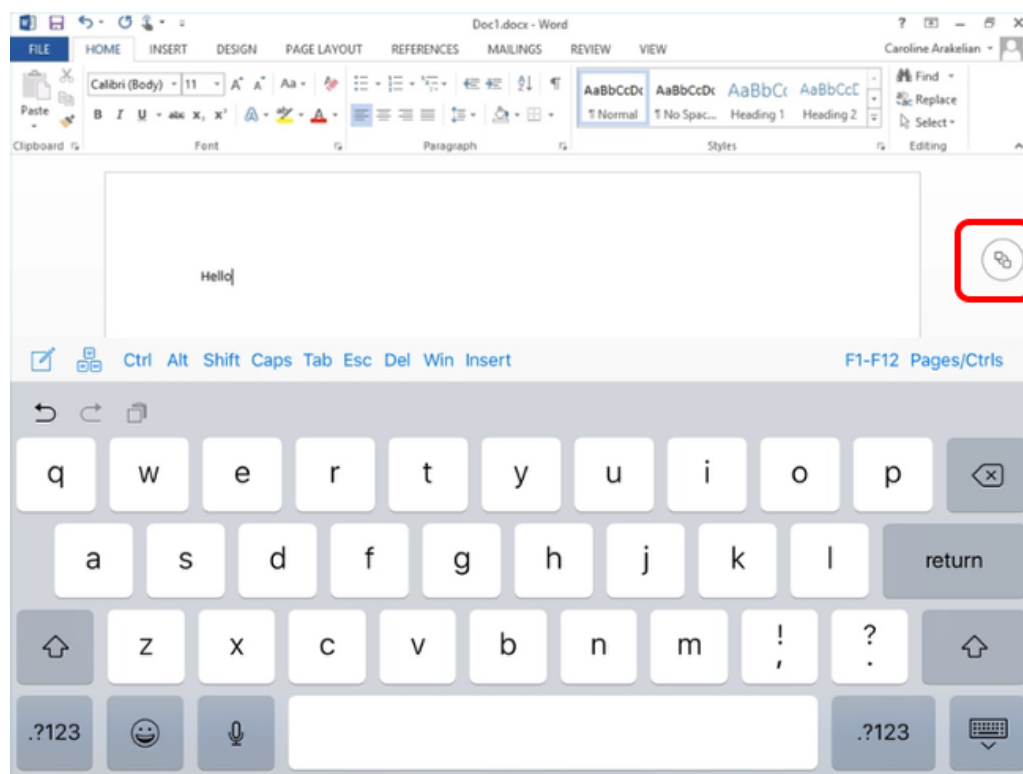

Tap in the application to enter text.

The on-screen keyboard appears unless you already have a keyboard attached to the device.

Above the traditional keyboard overlay is a row of Windows-specific keys such as arrow keys, Ctrl, Win, and so on.

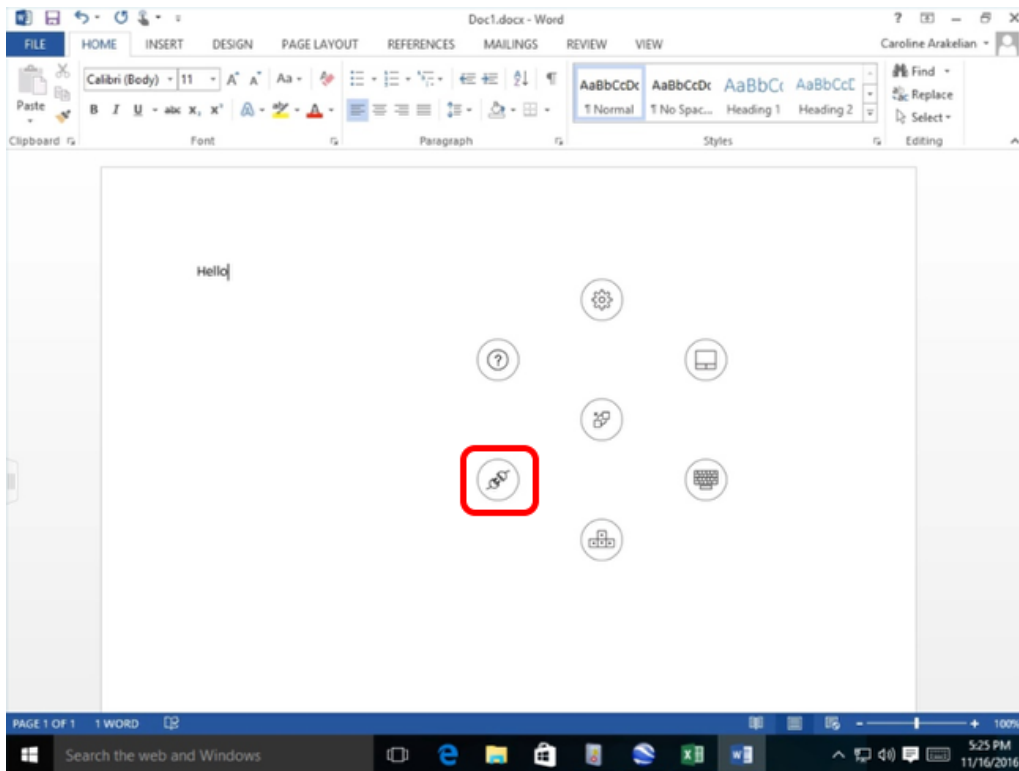

## 7. Tap the Horizon Client Tools Icon

Tap the Horizon Client Tools icon, and note the various icons for the various client settings.

The Horizon Client Tools enable you to perform such tasks as disconnecting from the session or bringing up the keyboard.

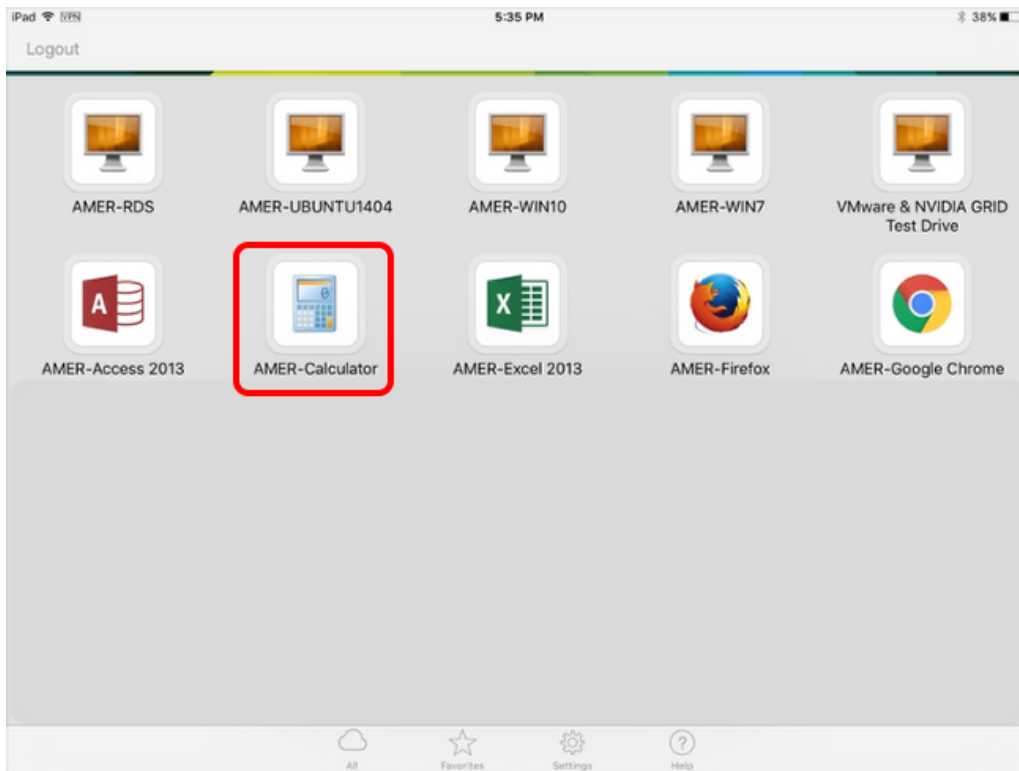

## 8. 9. Tap the Disconnect Icon

To end the desktop session, tap the **Disconnect** icon.

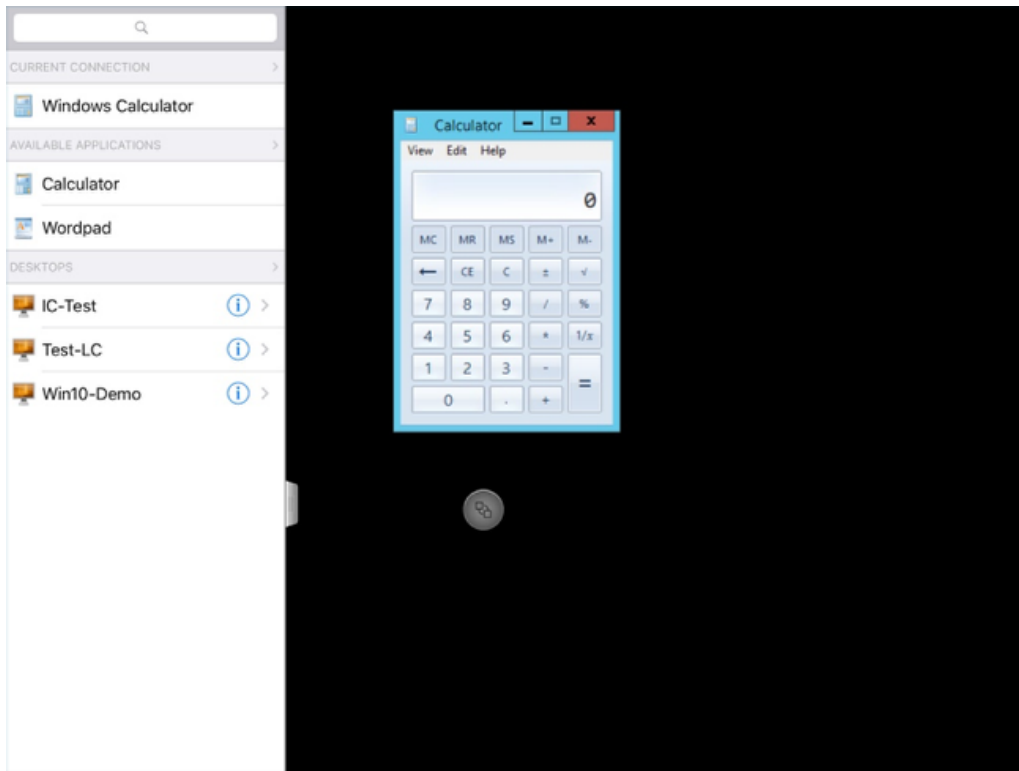

After you confirm that you want to disconnect, you are disconnected from your desktop session and returned to the list of available desktops and applications.

## 9. Launch a Published Application

On the desktop and application selector screen, tap a published application, such as Calculator.

The Calculator application appears, along with the sidebar. To exit out of the Calculator application, you can tap the Close button (X) just as you would for a Windows application installed on a Windows PC or laptop.

The Unity Touch sidebar displays a list of the other application pools and desktop pools the user is entitled to. You can use the sidebar to quickly switch to another desktop or published application provided by the server you are logged in to.

## 10. Launch a Desktop Using the Sidebar

Tap an arrow next to a desktop listed in the sidebar, and tap **Connect**. You are logged in to the desktop.

This exercise showed only a few of the features available on mobile clients. For more information about all the features for the various Horizon Clients, see the [VMware Horizon Client documentation](#).

# Troubleshooting

# Introduction to Troubleshooting

The exercises in this chapter demonstrate a couple of tools you can use for troubleshooting using the new Horizon Console UI.

For further information about troubleshooting, see the following Horizon 7 product documentation topics:

- [Troubleshooting Horizon 7](#), in the *Horizon 7 Administration* guide
- [Troubleshooting Machines and Desktop Pools](#), in the guide [Setting Up Virtual Desktops in Horizon 7](#)
- [Troubleshooting Horizon Client](#), in the applicable guide for the client operating system

# Monitor Remote Sessions

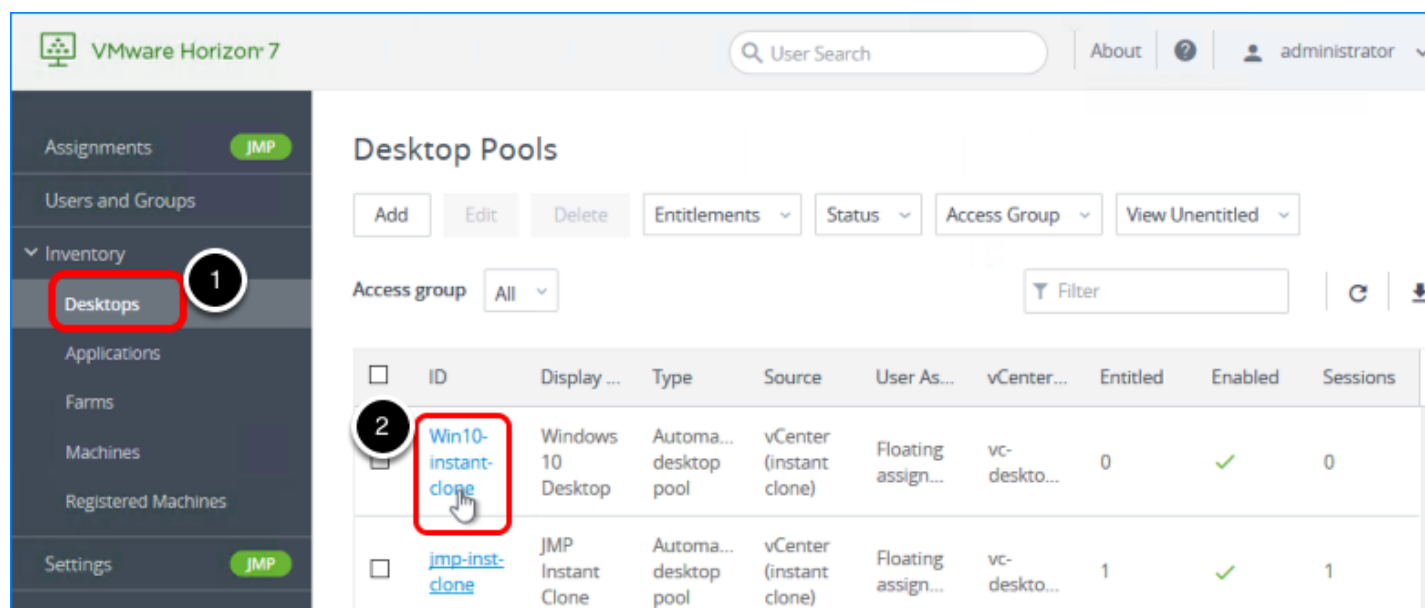

You can use Horizon Administrator and the new Horizon Console to monitor desktop and application sessions. These consoles give you a view into details from a farm, pool, or machine perspective. For example, you can see how many sessions are active for a pool. If you need to drill down into details for a particular user, the new Help Desk Tool is preferred, as is described in later exercises.

**Note:** To monitor linked-clone pools, which are created using the Composer, you must use Horizon Administrator. Linked-clone pools are visible but dimmed in the Horizon Console **Inventory > Desktops** list of desktop pools.

## Prerequisites for Monitoring Remote Sessions

To perform this exercise, you need to have created a desktop or application pool.

### 1. Go to the Summary Page for the Pool or RDSH Server Farm

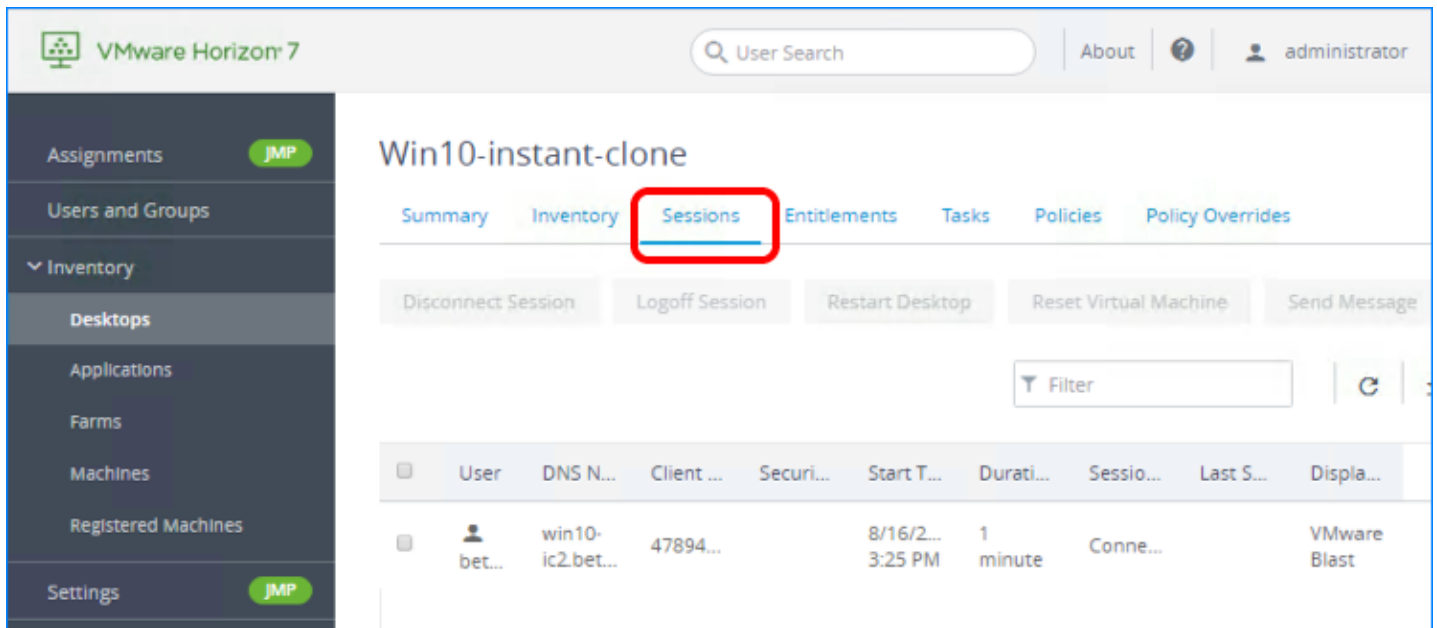

1. Log in to the Horizon Console, and select **Inventory > Desktops**, for VDI desktop pools, or **Inventory > Farms**, for RDSH server farms.

The format of the URL for accessing the console is:

<https://<connection-server-FQDN>/newadmin>

2. For VDI desktop pools, click the pool name on the Desktop Pools page. For published applications or desktops, click the farm name on the Farms page.

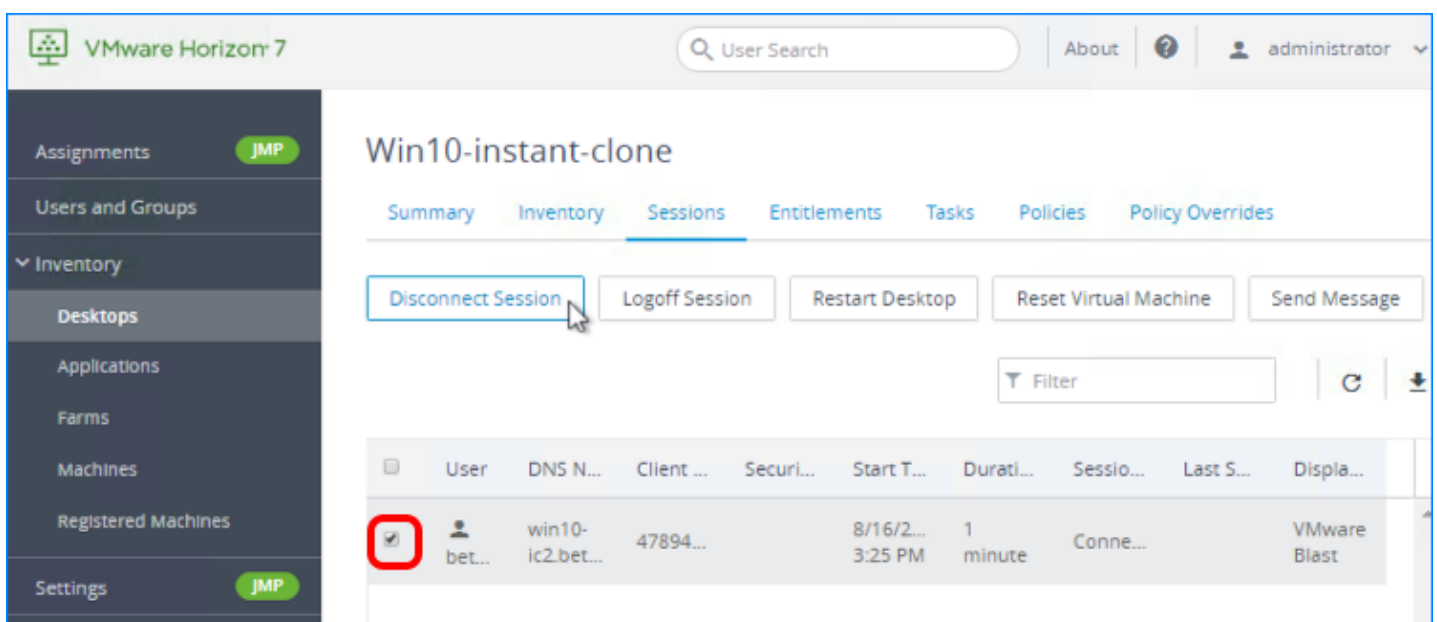

## 2. Monitor Sessions for a Desktop Pool or Farm

Click the Sessions tab to see the following information about each session:

- User name
- Host name
- Start and duration time
- Session state
- Display protocol; for example: Blast Extreme, PCoIP, RDP

## 3. Select Sessions

If you need to perform emergency maintenance tasks, you can select one or more users in the list, and click a button to

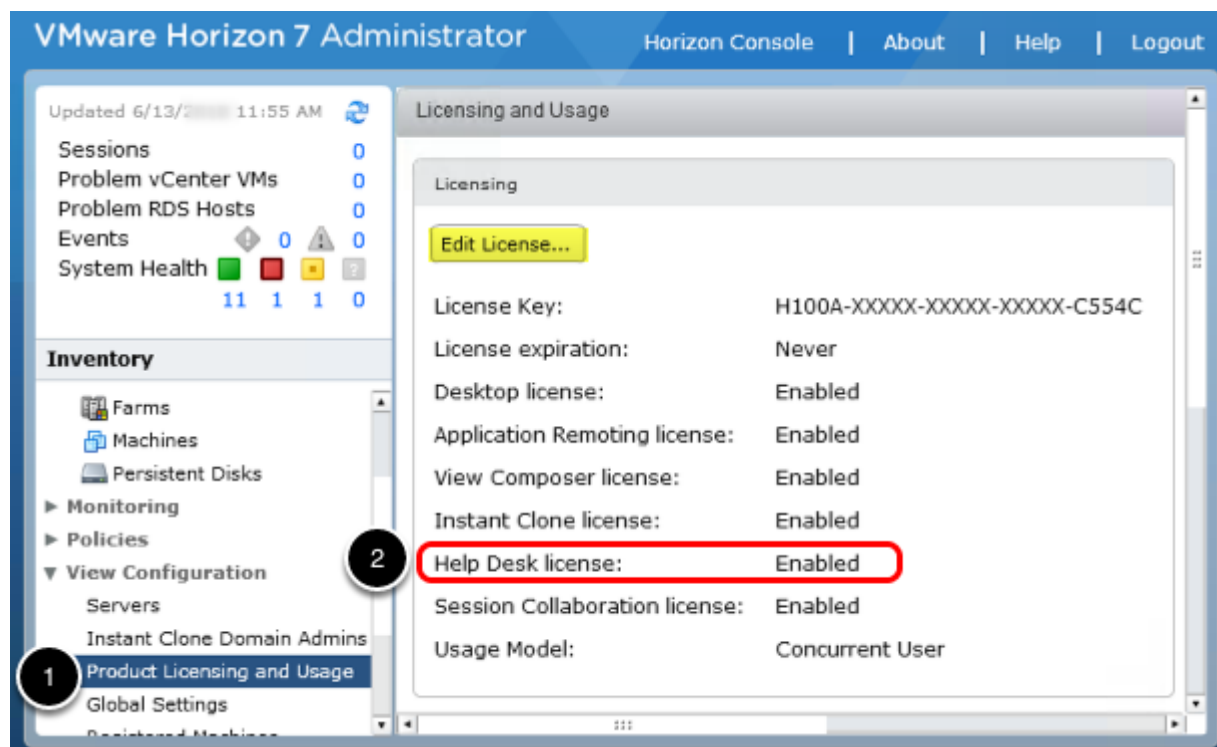

- Disconnect the session.
- Log the user out of the session.
- Restart the user's desktop.
- Reset the VM.
- Send a message to the user.

**Note:** The Restart Desktop and Reset Virtual Machine buttons are not available for RDSH server sessions.

# Verify Prerequisites for Using the Horizon Help Desk Tool

To use the Horizon Help Desk Tool to look up and troubleshoot user sessions, you must have the correct type of Horizon license and you must verify that at least one user account in Horizon Administrator has been assigned the required role.

## 1. Verify That the Horizon License Includes Horizon Help Desk Tool

1. Log in to Horizon Administrator, and select View Configuration > Product Licensing and Usage.

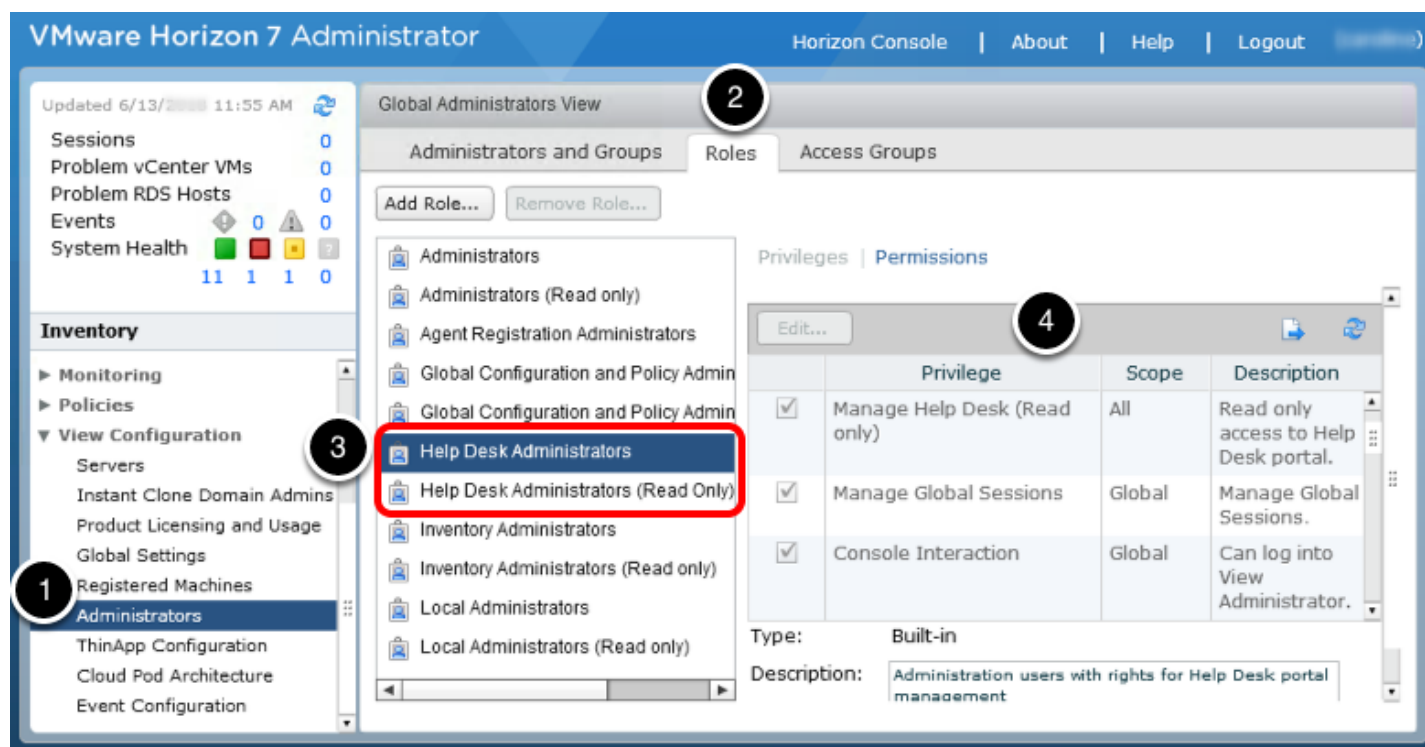

The format of the URL for accessing Horizon Administrator is:

```
https://<connection-server-FQDN>/admin
```

2. Verify that the Help Desk license is enabled.

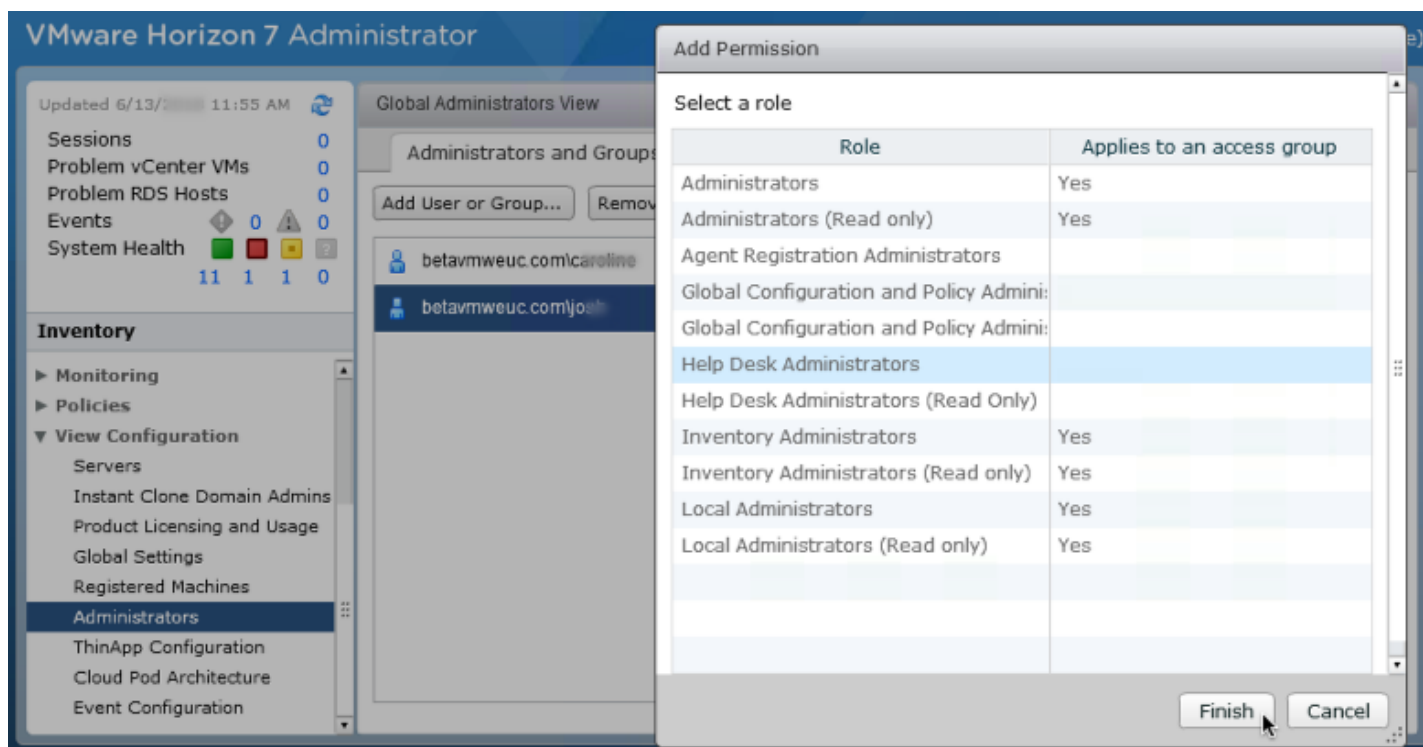

You must have a valid product license key for Horizon 7 Enterprise Edition or Horizon Apps Advanced. If you do not have the correct license, after you obtain one, you can click the Edit License button to add the new license.

## 2. Familiarize Yourself with the Help Desk Administrators Roles

1. In Horizon Administrator, select **View Configuration > Administrators**.
2. Click the **Roles** tab.
3. Select the **Help Desk Administrators** role.
4. Scroll through the **Permissions** list to see which permissions are granted to this role.

**Note:** If you installed the Horizon Connection Server that included this instance of Horizon Administrator, you were automatically given the Administrators role. This role includes all the permissions required for the Help Desk Administrator role. If you do not have the correct permissions, you will need to edit your permissions and add the Help Desk Administrators role, as shown in the following screen shot:

# Use the Help Desk Tool to Restart a User's Virtual Desktop

In this exercise, you are a help-desk administrator. An end user needs your help because their virtual desktop has stopped responding. For virtual desktops in this desktop pool, end users are not allowed to reset or restart their machines, so the user has asked you to restart the machine. Using the Horizon Help Desk Tool, you can perform this task in less than a minute.

You can perform many troubleshooting tasks for end users with this tool:

- Restart the desktop
- Send a message to the user
- Launch Microsoft Remote Assistance
- Disconnect the user session (without logging the user off)
- Log the user off of the machine
- Reset the machine, which equates to turning the power off and then on, and is useful if the OS freezes

The following section, [Troubleshooting Users in Horizon Help Desk Tool](#), lists all the details about the various types of information you can view for an end user. (10-minute read)

## Prerequisites

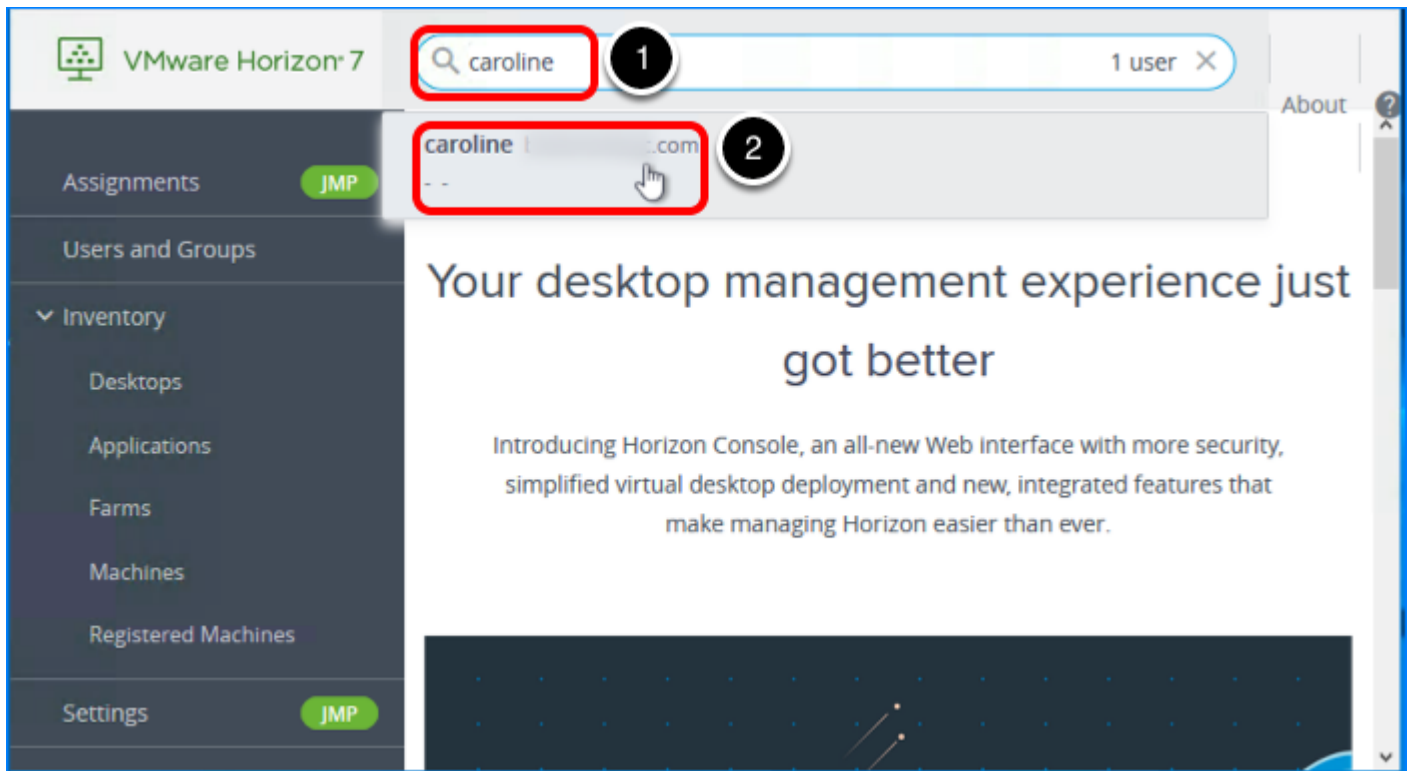

Use Horizon Client or the HTML Access web client to log in to a virtual desktop as an end user. After you connect to the desktop, an active session can appear in the Horizon Help Desk Tool.

## 1. Log In to Horizon Console

In Horizon Administrator, click **Horizon Console**.

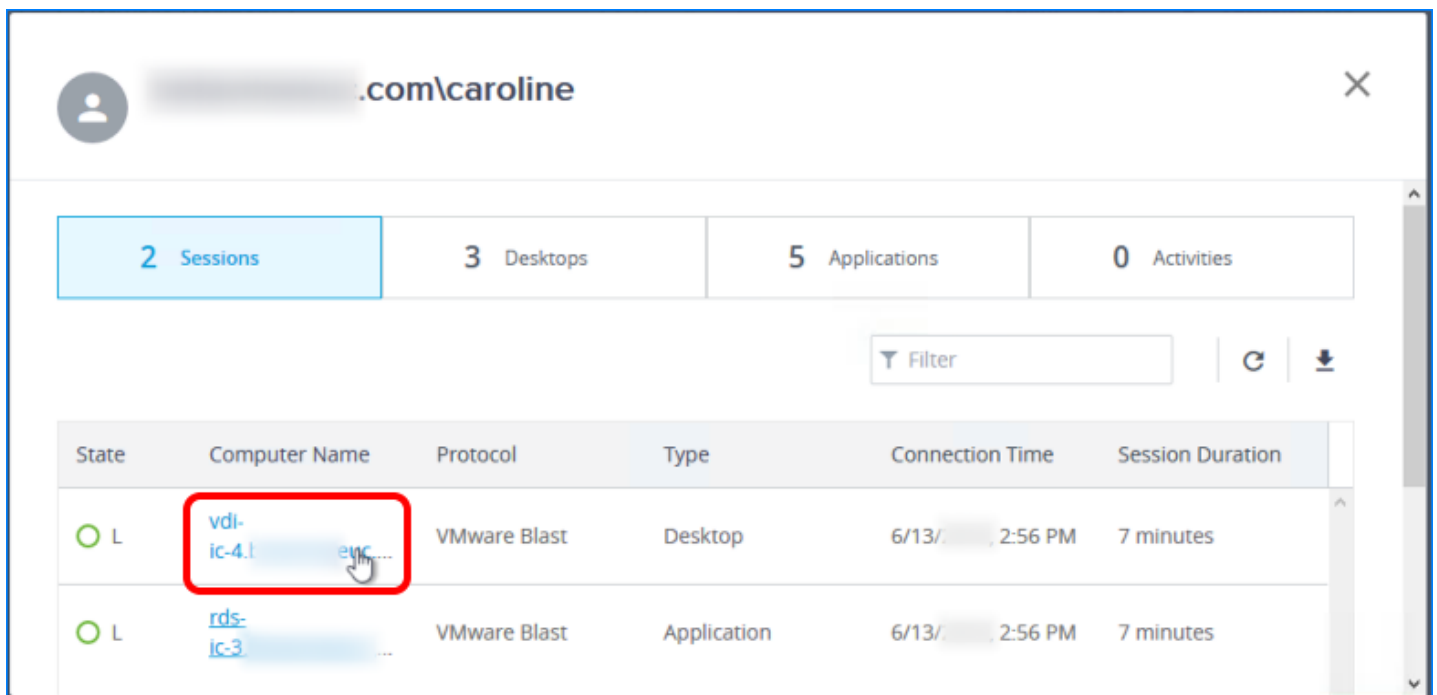

## 2. Select the End User

1. Log in to the Horizon Console, and enter the user's name in the search bar.  
The format of the URL for accessing the console is:  
`https://<connection-server-FQDN>/newadmin`
2. Select the user from the search results.

### 3. Select the Desktop or Application Session to Troubleshoot

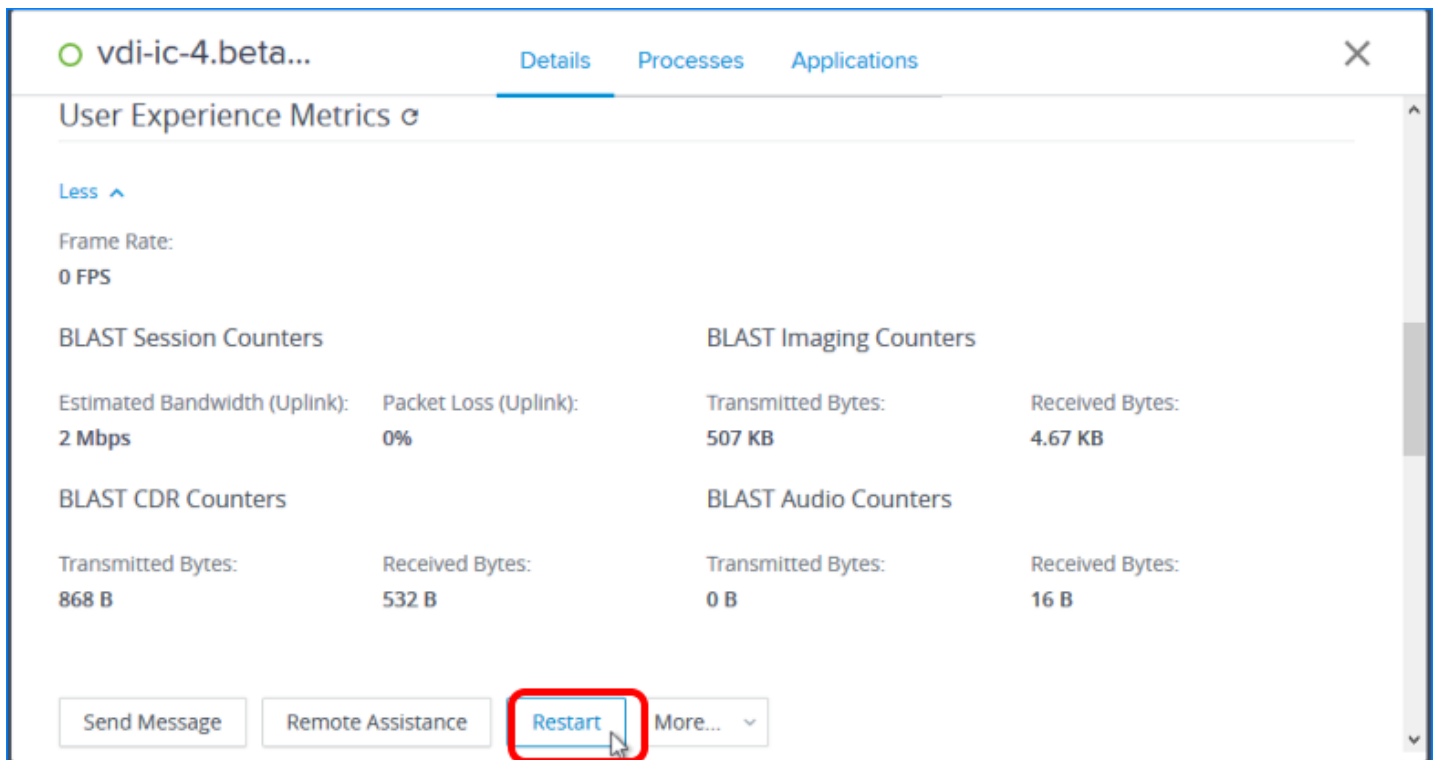

The screenshot shows the VMware Horizon user interface for a user named caroline. The 'Sessions' tab is selected, showing a list of active sessions. The first session, 'vdi-ic-4.l', is highlighted with a red box. The second session, 'rds-ic-3', is also visible.

State	Computer Name	Protocol	Type	Connection Time	Session Duration
L	vdi-ic-4.l	VMware Blast	Desktop	6/13/2023 2:56 PM	7 minutes
L	rds-ic-3	VMware Blast	Application	6/13/2023 2:56 PM	7 minutes

On the Sessions tab, in the list of active sessions, click an item in the Computer Name column.

### 4. Scroll Down and Click the Restart Button

The screenshot shows the VMware Horizon session details page for the session 'vdi-ic-4.beta...'. The 'Details' tab is selected. The page displays various performance metrics and counters. At the bottom, there are buttons for 'Send Message', 'Remote Assistance', 'Restart', and 'More...'. The 'Restart' button is highlighted with a red box.

User Experience Metrics

Less

Frame Rate: 0 FPS

BLAST Session Counters

Estimated Bandwidth (Uplink): 2 Mbps

Packet Loss (Uplink): 0%

BLAST Imaging Counters

Transmitted Bytes: 507 KB

BLAST CDR Counters

Transmitted Bytes: 868 B

Received Bytes: 532 B

BLAST Audio Counters

Transmitted Bytes: 0 B

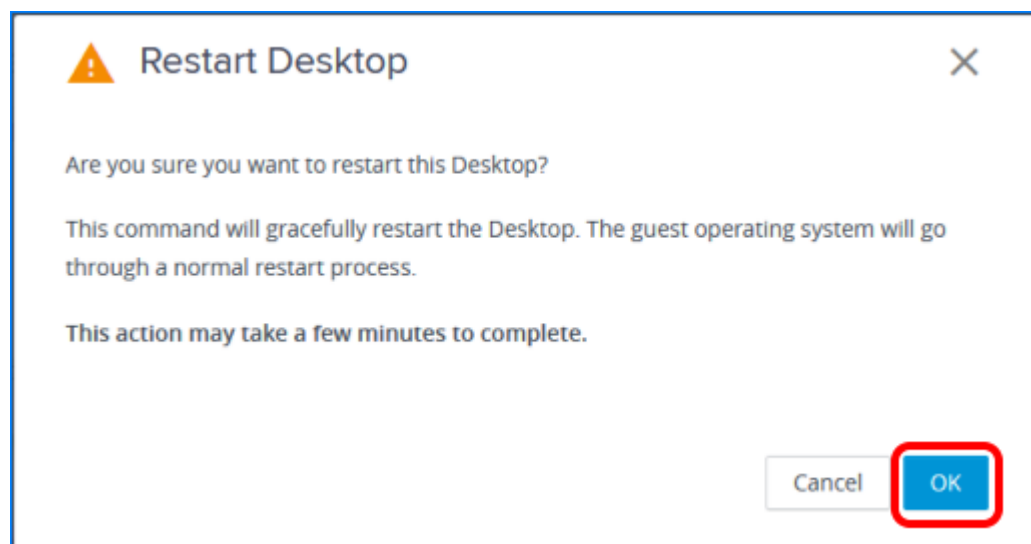

Received Bytes: 16 B

Send Message Remote Assistance Restart More...

Scroll down the **Details** tab until you get to the end of the User Experience Metrics section, and click **Restart**.

Also note the other troubleshooting options. The **Remote Assistance** option is based on Microsoft Remote Assistance. If you click **More**, the additional options are **Disconnect**, **Logoff**, and **Reset**. For more information, see [Troubleshoot Desktop or Application Sessions in Horizon Help Desk Tool](#).

## 5. Confirm Restarting the Desktop

Click **OK**. You are returned to the Sessions list, and the session for the desktop is removed from the list.

For application sessions, the troubleshooting options are slightly different, as shown in the following screenshot.

**rds-ic-3.beta...** Details Processes Applications

Farm:  
RDS-IC-Farm

Session Duration: 7 minutes      Session State: Idle      State Duration: 1 minute

Logon Time: 6/13/2023, 2:56 PM      Logon Duration: 61.62 s

Be sure to see the [VMware Horizon v7.5 Help Desk Tool Feature Walkthrough](#) video for the Horizon 7 Help Desk.

# Summary and Additional Resources

# Summary

This quick-start guide demonstrated just how quickly and easily you can use VMware Horizon 7 to create VDI desktops and RDSH-published applications and desktops using a Horizon 7 on-premises infrastructure. You completed simple wizards to install and configure a Connection Server, which streamlines provisioning of RDSH servers and cloned desktops.

You then created automated desktop pools and an automated RDSH farm. With one simple wizard, you created multiple application pools. Next, you entitled end users to applications and desktops. In addition, this guide provided an overview of features, architecture, and components.

Finally, you enjoyed the end-user experience of launching desktops published applications from the Windows-based Horizon Client, the iOS-based Horizon Client, and the web-based HTML Access client. The native client software can be installed on Windows, Windows UWP, macOS, Linux, Chromebook, iOS, and Android endpoint devices.

Because this guide is meant to get you started quickly, it does not delve into details of all the options and features that provide a rich user experience:

- Support for use cases such as graphics-intensive 3D applications with NVIDIA GRID vGPU and Unified Communications with Microsoft Skype for Business.
- Quick and easy access to a user's files from their virtual desktops and applications with file-type association
- Support for the most commonly used peripherals, including printers, scanners and imaging devices, smart cards, and USB storage devices
- Performance optimizations to increase application responsiveness

For more information about these and other topics, see the [VMware Horizon 7 documentation](#).

# Additional Resources

The following documents are companion quick-start tutorials for Horizon 7:
